

NAME

epsffit – fit encapsulated PostScript file (EPSF) into constrained size

SYNOPSIS

epsffit [-c] [-r] [-a] [-m] [-s] *llx lly urx ury* [*infile* [*outfile*]]

DESCRIPTION

Epsffit fits an EPSF file (encapsulated PostScript) to a given bounding box. The coordinates of the box are given by (*llx,lly*) for the lower left, and (*urx,ury*) for the upper right, in PostScript units (points).

If no input or output files are specified, **epsffit** reads from the standard input and writes to the standard output.

OPTIONS

- c** Center the image in the given bounding box.
- r** Rotate the image by 90 degrees counter-clockwise.
- a** Adjust the aspect ratio to fit the bounding box. The default is to preserve the aspect ratio.
- m** Rotates the image to maximise the size if it would fit the specified bounding box better.
- s** Add a **showpage** at the end of the file to force the image to print.
