

The program `nfssfont`

Frank Mittelbach*

2015/02/01

This file is maintained by the L^AT_EX Project team.
Bug reports can be opened (category `latex`) at
<https://latex-project.org/bugs.html>.

1 Introduction

Within the NFSS distribution there is a L^AT_EX file `nfssfont.tex` which can be used to test new fonts, produce font tables showing all characters, etc. This is an addaption of a program originally written by Don Knuth.

When you run this file through L^AT_EX you will be asked to enter the name of the font to test. Your answer should be the external font name without any extension, e.g. `cmr10` (Computer Modern Roman 10pt) or `yinit` (Yannis Haralambous' Initial font).

Alternatively (since version 2.1), you can press `<return>` at this point. In that case a dialog is started that asks you for the font characteristics in NFSS notation, i.e., first for the encoding scheme (default `T1`), then for the family name (default `cmr`), then for the series (default `m`), then for the shape (default `n`), and finally for the size (default `10pt`).

You are then requested to enter a command. Probably the most important one is `\table`, which will produce a font chart. To switch to a new test font, type `\init`; to finish the test, type `\bye`; and to learn about all the other possible tests type `\help`.

This is at the moment only a crude addaption of the test program for the Computer Modern fonts by Donald Knuth.

2 A driver for this document

The next bit of code contains the documentation driver file for T_EX, i.e., the file that will produce the documentation you are currently reading. It will be extracted from this file by the DOCSTRIP program.

```
1 <*driver>
2 \documentclass{ltxdoc}
3 % \OnlyDescription % comment out for implementation details
4 \begin{document}
```

*Adapted from code written by Donald E. Knuth

```

5 \DocInput{nfssfont.dtx}
6 \end{document}
7 \</driver>

```

3 The code

A testbed for font evaluation (see The METAFONTbook, Appendix H) changed for L^AT_EX with NFSS.

This program should get a complete rewrite some day or at least some code documentation. Any volunteers?

```

39   \space\number\day, \number\year}
40 \def\hours{\n=\time \divide\n 60
41   \m=-\n \multiply\m 60 \advance\m \time
42   \twodigits\n\twodigits\m}
43 \def\twodigits#1{\ifnum #1<10 0\fi \number#1}
44
45 \def\init{%
46   \typein[\currfontname]%
47   {Input external font name, e.g., cmr10^J%
48     (or <enter> for NFSS classification of font):}%

```

If the answer is a real font name (like “cmr10”) then we have no idea what the encoding of this font is, so in this case we record the word “unknown” and internally assume T1 encoding. Commands other than `\table` are then most likely going to fail, unless that assumption was correct.

```
47 \def\encoding{unknown}%
48 \fontencoding{T1}\selectfont
```

If the user answers with “return” we ask for the NFSS classification of the font in form of encoding, family, series, shape, and size offering a default each time.

```
49 \ifx\currfontname\empty
50 \typein[\encoding]{^^J^^J*** NFSS classification
51                ***^^J^^JFont encoding [T1]:}%
52 \ifx\encoding\empty
53 \fontencoding{T1}%
54 \def\encoding{T1}%
55 \else
```

Depending on the chosen encoding we have the problem, that the encoding support information may not be available (only for T1 and OT1 this is preloaded in the kernel, all other encodings normally need a declaration in the preamble). So here we attempt to load this support file even though it is actually already too late for this.

```
56 \edef\next{%
57     \lowercase{\def\noexpand\next{\encoding enc.def}}}%
58 \next
59 \makeatletter
60 \InputIfFileExists\next
61 {}%
```

If the encoding support file is not found this may indicate an error, eg something misspelled. However, it may equally mean that we dealing with a math font encoding for which no encoding support is available.

```
62 {\PackageWarningNoLine{nfssfont}%
63   {Encoding file ‘\next’ not found.%
64   \MessageBreak
65   You might have misspelt the name of the encoding
66   \MessageBreak
67   or perhaps this encoding is not a text encoding,
68   \MessageBreak
69   in which case you will probably only be able to
70   \MessageBreak
71   run the \noexpand\table command successfully}}%
```

But actually the situation is even worse, as some math encodings do have such support files. So for them we need to make the encoding known to NFSS in some other way, otherwise we could not even find the external font name, let alone typesetting a `\table`.

```
72 \expandafter\let\csname T@\encoding\endcsname\empty
73 }%
74 \makeatother
75 \let\next\relax
76 \fontencoding\encoding
77 \fi
78 \typein[\family]{Font family [cmr]:}%
```

```

79 \relax
80 \ifx\family\empty
81   \fontfamily{cmr}%
82 \else
83   \fontfamily\family
84 \fi
85 \typein[\series]{Font series [m]:}%
86 \ifx\series\empty
87   \fontseries{m}%
88 \else
89   \fontseries\series
90 \fi
91 \typein[\shape]{Font shape [n]:}%
92 \ifx\shape\empty
93   \fontshape{n}%
94 \else
95   \fontshape\shape
96 \fi
97 \typein[\size]{Font size [10pt]:}%
98 \ifx\size\empty
99   \fontsize{10}{10}%
100 \else
101   \fontsize\size\size
102 \fi

```

Then select the font and assign it to `\currfontname`.

```

103 \selectfont\edef\currfontname{\fontname\font}%
104 \fi
105 \startfont

```

Finally we ask for some “action” and offer `\table\bye` as default—basically I got tired of having to type that in each time. If some other action is given you end with a `*` prompt and have to finish the run with `\bye` yourself eventually.

```

106 \typein[\action]{Now type a test command or
107   \string\help\space for help [ \string\table\space\string\bye\space]:}%
108 \ifx\action\empty
109   \expandafter\table\expandafter\bye
110 \fi
111 }

```

```
