

tagpdf – A package to experiment with pdf tagging*

Ulrike Fischer[†]

Released 2021-06-29

Contents

1	Initialization and test if pdfmanagement is active.	6
2	Package options	6
3	Packages	6
4	Temporary code	6
	4.1 a LastPage label	7
5	Variables	7
6	Variants of l3 commands	9
7	Setup label attributes	9
8	Label commands	9
9	Commands to fill seq and prop	10
10	General tagging commands	10
11	Keys for tagpdfsetup	11
12	loading of engine/more dependent code	12
I	The tagpdf-checks module	
	Messages and check code	
	Part of the tagpdf package	13
1	Commands	13

*This file describes v0.9, last revised 2021-06-29.

[†]E-mail: fischer@troubleshooting-tex.de

2	Description of log messages	13
2.1	\ShowTagging command	13
2.2	Messages in checks and commands	13
2.3	Warning messages from the lua-code	14
2.4	Info messages from the lua-code	14
3	Messages	15
3.1	Messages related to mc-chunks	15
3.2	Messages related to mc-chunks	16
3.3	Attributes	16
3.4	Roles	17
3.5	Miscellaneous	17
4	Retrieving data	17
5	User conditionals	17
6	Internal checks	18
6.1	checks for active tagging	18
6.2	Checks related to stuctures	18
6.3	Checks related to roles	20
6.4	Check related to mc-chunks	20

II The tagpdf-user module

Code related to L^AT_EX2e user commands and document commands

	Part of the tagpdf package	24
1	Setup commands	24
2	Commands related to mc-chunks	24
3	Commands related to structures	24
4	Debugging	25
5	Extension commands	25
5.1	Fake space	25
5.2	Paratagging	25
5.3	Link tagging	26
6	User commands and extensions of document commands	26
7	Setup and preamble commands	26
8	Commands for the mc-chunks	26
9	Commands for the structure	27
10	Debugging	28

11	Commands to extend document commands	30
11.1	Document structure	30
11.2	Fake space	30
11.3	Paratagging	30
11.4	Links	32
III	The <code>tagpdf-tree</code> module	
	Commands trees and main dictionaries	
	Part of the <code>tagpdf</code> package	34
1	Trees, pdfmanagement and finalization code	34
1.1	Catalog: MarkInfo and StructTreeRoot	34
1.2	Writing structure elements	35
1.3	ParentTree	35
1.4	Rolemap dictionary	38
1.5	Classmap dictionary	38
1.6	Namespaces	39
1.7	Finishing the structure	40
1.8	StructParents entry for Page	40
IV	The <code>tagpdf-mc-shared</code> module	
	Code related to Marked Content (mc-chunks), code shared by	
	all modes	
	Part of the <code>tagpdf</code> package	41
1	Public Commands	41
2	Public keys	42
3	Marked content code – shared	42
3.1	Variables and counters	43
3.2	Functions	44
3.3	Keys	46
V	The <code>tagpdf-mc-generic</code> module	
	Code related to Marked Content (mc-chunks), generic mode	
	Part of the <code>tagpdf</code> package	47
1	Marked content code – generic mode	47
1.1	Variables	47
1.2	Functions	47
1.3	Keys	51
VI	The <code>tagpdf-mc-luacode</code> module	
	Code related to Marked Content (mc-chunks), luamode-specific	
	Part of the <code>tagpdf</code> package	53

1	Marked content code – luamode code	53
1.1	Commands	54
1.2	Key definitions	58
VII	The tagpdf-struct module	
	Commands to create the structure	
	Part of the tagpdf package	61
1	Public Commands	61
2	Public keys	61
2.1	Keys for the structure commands	61
2.2	Setup keys	63
3	Variables	63
3.1	Variables used by the keys	65
4	Commands	65
4.1	Initialization of the StructTreeRoot	66
4.2	Handlings kids	67
5	Keys	71
6	User commands	75
7	Attributes and attribute classes	78
7.1	Variables	78
7.2	Commands and keys	78
VIII	The tagpdf-luatex.def	
	Driver for luatex	
	Part of the tagpdf package	81
1	Loading the lua	81
2	Logging functions	85
3	Helper functions	87
3.1	Retrieve data functions	87
3.2	Functions to insert the pdf literals	89
4	Function for the real space chars	90
5	Function for the tagging	93
6	Parenttree	97

IX	The <code>tagpdf-roles</code> module	
	Tags, roles and namespace code	
	Part of the <code>tagpdf</code> package	99
1	Code related to roles and structure names	99
1.1	Variables	99
1.2	Namespaces	100
1.3	Data	101
1.4	Adding new tags and rolemapping	107
1.4.1	pdf 1.7 and earlier	107
1.4.2	The pdf 2.0 version	108
1.5	Key-val user interface	109
X	The <code>tagpdf-space</code> module	
	Code related to real space chars	
	Part of the <code>tagpdf</code> package	111
1	Code for interword spaces	111
	Index	113

1 Initialization and test if pdfmanagement is active.

```
1 <@@=tag>
2 <*package>
3 \ProvidesExplPackage {tagpdf} {2021-06-29} {0.9}
4 { A package to experiment with pdf tagging }
5
6 \bool_if:nF
7 {
8   \bool_lazy_and_p:nn
9     {\cs_if_exist_p:N \pdfmanagement_if_active_p:}
10    {\pdfmanagement_if_active_p: }
11 }
12 { %error for now, perhaps warning later.
13   \PackageError{tagpdf}
14     {
15       PDF-resource-management-is-no-active!\MessageBreak
16       tagpdf-will-no-work.
17     }
18     {
19       Activate-it-with \MessageBreak
20       \string\RequirePackage{pdfmanagement-testphase}\MessageBreak
21       \string\DeclareDocumentMetadata{<options>}\MessageBreak
22       before~\string\documentclass
23     }
24 }
```

We map the internal module name “tag” to “tagpdf” in messages.

```
25 \prop_if_exist:NT \g_msg_module_name_prop
26 {
27   \prop_gput:Nnn \g_msg_module_name_prop { tag }{ tagpdf }
28 }
```

2 Package options

There are only two options to switch for luatex between generic and luamode, TODO try to get rid of them.

```
29 \bool_new:N\g__tag_mode_lua_bool
30 \DeclareOption {luamode} { \sys_if_engine luatex:T { \bool_gset_true:N \g__tag_mode_lua_bool } }
31 \DeclareOption {genericmode}{ \bool_gset_false:N\g__tag_mode_lua_bool }
32 \ExecuteOptions{luamode}
33 \ProcessOptions
```

3 Packages

We need the temporary version of l3ref until this is in the kernel.

```
34 \RequirePackage{l3ref-tmp}
```

4 Temporary code

This is code which will be removed when proper support exists in LaTeX

4.1 a LastPage label

See also issue #2 in Accessible-xref

`_tag_lastpagelabel:`

```

35 \cs_new_protected:Npn \_tag_lastpagelabel:
36 {
37   \legacy_if:nT { @files }
38   {
39     \exp_args:NNx \exp_args:NNx\iow_now:Nn \@auxout
40     {
41       \token_to_str:N \newlabeldata
42       {\_tag_LastPage}
43       {
44         {abspage} { \int_use:N \g_shipout_readonly_int }
45         {tagmcabs}{ \int_use:N \c@g__tag_MCID_abs_int }
46       }
47     }
48   }
49 }
50
51 \AddToHook{enddocument/afterlastpage}
52 {\_tag_lastpagelabel:}

```

(End definition for _tag_lastpagelabel:.)

`\ref_value:nnn` This allows to locally set a default value if the label or the attribute doesn't exist. See issue #4 in Accessible-xref.

```

\ref_value:nnn{<label>}{<attribute>}{<Fallback default>}

53 \cs_if_exist:NF \ref_value:nnn
54 {
55   \cs_new:Npn \ref_value:nnn #1#2#3
56   {
57     \exp_args:Nee
58     \_ref_value:nnn
59     { \tl_to_str:n {#1} } { \tl_to_str:n {#2} } {#3}
60   }
61   \cs_new:Npn \_ref_value:nnn #1#2#3
62   {
63     \tl_if_exist:cTF { g__ref_label_ #1 _ #2 _tl }
64     { \tl_use:c { g__ref_label_ #1 _ #2 _tl } }
65     {
66       #3
67     }
68   }
69 }

```

(End definition for \ref_value:nnn. This function is documented on page ??.)

5 Variables

`\l__tag_tmpa_tl` A few temporary variables
`\l__tag_tmpa_str`
`\l__tag_tmpa_prop`
`\l__tag_tmpa_seq`
`\l__tag_tmpb_seq`
`\l__tag_tmpa_clist`
`\l__tag_tmpa_int`

```

70 \tl_new:N \l__tag_tmpa_tl
71 \str_new:N \l__tag_tmpa_str
72 \prop_new:N \l__tag_tmpa_prop
73 \seq_new:N \l__tag_tmpa_seq
74 \seq_new:N \l__tag_tmpb_seq
75 \clist_new:N \l__tag_tmpa_clist
76 \int_new:N \l__tag_tmpa_int

```

(End definition for `\l__tag_tmpa_tl` and others.)

Attribute lists for the label command. We have a list for mc-related labels, and one for structures.

```

\c__tag_refmc_clist
\c__tag_refstruct_clist
77 \clist_const:Nn \c__tag_refmc_clist {tagabspage,tagmcabs,tagmcid}
78 \clist_const:Nn \c__tag_refstruct_clist {tagstruct,tagstructobj}

```

(End definition for `\c__tag_refmc_clist` and `\c__tag_refstruct_clist`.)

`\l__tag_loglevel_int` This integer hold the log-level and so allows to control the messages. TODO: a list which log-level shows what is needed. The current behaviour is quite ad-hoc.

```

79 \int_new:N \l__tag_loglevel_int

```

(End definition for `\l__tag_loglevel_int`.)

`\g__tag_active_space_bool` These booleans should help to control the global behaviour of tagpdf. Ideally it should more or less do nothing if all are false. The space-boolean controles the interword space code, the mc-boolean activates `\tag_mc_begin:n`, the tree-boolean activates writing the finish code and the pdfmanagement related commands, the struct-boolean activates the storing of the structure data. In a normal document all should be active, the split is only there for debugging purpose. Also we assume currently that they are set only at begin document. But if some control passing over groups are needed they could be perhaps used in a document too. TODO: check if they are used everywhere as needed and as wanted.

```

80 \bool_new:N \g__tag_active_space_bool
81 \bool_new:N \g__tag_active_mc_bool
82 \bool_new:N \g__tag_active_tree_bool
83 \bool_new:N \g__tag_active_struct_bool

```

(End definition for `\g__tag_active_space_bool` and others.)

`\l__tag_active_mc_bool` These booleans should help to control the *local* behaviour of tagpdf. In some cases it could e.g. be necessary to stop tagging completely. As local booleans they respect groups. TODO: check if they are used everywhere as needed and as wanted.

```

84 \bool_new:N \l__tag_active_mc_bool
85 \bool_set_true:N \l__tag_active_mc_bool
86 \bool_new:N \l__tag_active_struct_bool
87 \bool_set_true:N \l__tag_active_struct_bool

```

(End definition for `\l__tag_active_mc_bool` and `\l__tag_active_struct_bool`.)

`\g__tag_tagunmarked_bool` This boolean controls if the code should try to automatically tag parts not in mc-chunk. It is currently only used in luamode. It would be possible to used it in generic mode, but this would create quite a lot empty artifact mc-chunks.

```

88 \bool_new:N \g__tag_tagunmarked_bool

```

(End definition for `\g__tag_tagunmarked_bool`.)

6 Variants of l3 commands

```

89 \prg_generate_conditional_variant:Nnn \pdf_object_if_exist:n {e}{T,F}
90 \cs_generate_variant:Nn \pdf_object_ref:n {e}
91 \cs_generate_variant:Nn \pdfannot_dict_put:nnn {nnx}
92 \cs_generate_variant:Nn \pdffile_embed_stream:nnn {nxx,oxx}
93 \cs_generate_variant:Nn \prop_gput:Nnn {Nxx}
94 \cs_generate_variant:Nn \prop_put:Nnn {Nxx}
95 \cs_generate_variant:Nn \ref_label:nn { nv }
96 \cs_generate_variant:Nn \seq_set_split:Nnn{Nne}
97 \cs_generate_variant:Nn \str_set_convert:Nnnn {Nonn, Noon, Nnon }

```

7 Setup label attributes

`tagstruct` This are attributes used by the label/ref system. With structures we store the structure number `tagstruct` and the object reference `tagstructobj`. The second is needed to be able to reference a structure which hasn't been created yet. The alternative would be to create the object in such cases, but then we would have to check the object existence all the time.

With mc-chunks we store the absolute page number `tagabspage`, the absolute id `tagmcabc`, and the id on the page `tagmcid`.

```

98 \ref_attribute_gset:nnnn { tagstruct } {0} { now }
99 { \int_use:N \c@g__tag_struct_abs_int }
100 \ref_attribute_gset:nnnn { tagstructobj } {} { now }
101 {
102   \pdf_object_if_exist:eT {__tag/struct/\int_use:N \c@g__tag_struct_abs_int}
103   {
104     \pdf_object_ref:e{__tag/struct/\int_use:N \c@g__tag_struct_abs_int}
105   }
106 }
107 \ref_attribute_gset:nnnn { tagabspage } {0} { shipout }
108 { \int_use:N \g_shipout_readonly_int }
109 \ref_attribute_gset:nnnn { tagmcabs } {0} { now }
110 { \int_use:N \c@g__tag_MCID_abs_int }
111 \ref_attribute_gset:nnnn {tagmcid } {0} { now }
112 { \int_use:N \g__tag_MCID_tmp_bypage_int }

```

(End definition for tagstruct and others. These functions are documented on page ??.)

8 Label commands

`__tag_ref_label:nn` A version of `\ref_label:nn` to set a label which takes a keyword `mc` or `struct` to call the relevant lists. TODO: check if `\@bsphack` and `\@esphack` make sense here.

```

113 \cs_new_protected:Npn \__tag_ref_label:nn #1 #2 %#1 label, #2 name of list mc or struct
114 {
115   \@bsphack
116   \ref_label:nv {#1}{c__tag_ref#2_clist}
117   \@esphack
118 }
119 \cs_generate_variant:Nn \__tag_ref_label:nn {en}

```

(End definition for __tag_ref_label:nn.)

`__tag_ref_value:nnn` A local version to retrieve the value. It is a direct wrapper, but to keep naming consistent It uses the variant defined temporarily above.

```

120 \cs_new:Npn \__tag_ref_value:nnn #1 #2 #3 %#1 label, #2 attribute, #3 default
121 {
122   \ref_value:nnn {#1}{#2}{#3}
123 }
124 \cs_generate_variant:Nn \__tag_ref_value:nnn {enn}

```

(End definition for `__tag_ref_value:nnn`.)

`__tag_ref_value_lastpage:nn` A command to retrieve the lastpage label, this will be adapted when there is a proper, kernel lastpage label.

```

125 \cs_new:Npn \__tag_ref_value_lastpage:nn #1 #2
126 {
127   \ref_value:nnn {\__tag_LastPage}{#1}{#2}
128 }

```

(End definition for `__tag_ref_value_lastpage:nn`.)

9 Commands to fill seq and prop

With most engines these are simply copies of the expl3 commands, but luatex will overwrite them, to store the data also in lua tables.

```

\__tag_prop_new:N
\__tag_seq_new:N 129 \cs_set_eq:NN \__tag_prop_new:N \prop_new:N
\__tag_prop_gput:Nnn 130 \cs_set_eq:NN \__tag_seq_new:N \seq_new:N
\__tag_seq_gput_right:Nn 131 \cs_set_eq:NN \__tag_prop_gput:Nnn \prop_gput:Nnn
\__tag_seq_item:cn 132 \cs_set_eq:NN \__tag_seq_gput_right:Nn \seq_gput_right:Nn
\__tag_prop_item:cn 133 \cs_set_eq:NN \__tag_seq_item:cn \seq_item:cn
\__tag_seq_show:N 134 \cs_set_eq:NN \__tag_prop_item:cn \prop_item:cn
\__tag_prop_show:N 135 \cs_set_eq:NN \__tag_seq_show:N \seq_show:N
136 \cs_set_eq:NN \__tag_prop_show:N \prop_show:N
137
138 \cs_generate_variant:Nn \__tag_prop_gput:Nnn { NxN , Nxx, Nnx , cnn, cxn, cnx, cno}
139 \cs_generate_variant:Nn \__tag_seq_gput_right:Nn { Nx , No, cn, cx }
140 \cs_generate_variant:Nn \__tag_prop_new:N { c }
141 \cs_generate_variant:Nn \__tag_seq_new:N { c }
142 \cs_generate_variant:Nn \__tag_seq_show:N { c }
143 \cs_generate_variant:Nn \__tag_prop_show:N { c }

```

(End definition for `__tag_prop_new:N` and others.)

10 General tagging commands

`\tag_stop_group_begin:` We need a command to stop tagging in some places. This simply switches the two local booleans.

```

144 \cs_new_protected:Npn \tag_stop_group_begin:
145 {
146   \group_begin:
147   \bool_set_false:N \l__tag_active_struct_bool
148   \bool_set_false:N \l__tag_active_mc_bool

```

```

149     }
150 \cs_set_eq:NN \tag_stop_group_end: \group_end:

```

(End definition for \tag_stop_group_begin: and \tag_stop_group_end:. These functions are documented on page ??.)

11 Keys for tagpdfsetup

TODO: the log-levels must be sorted

activate-space Keys to (globally) activate tagging. **activate-space** activates the additional parsing needed for interword spaces. It is not documented, the parsing is currently implicitly activated by the known key **interwordspace**, as the code will perhaps move to some other place, now that it is better separated.

```

activate-mc
activate-tree
activate-struct
activate-all
151 \keys_define:nn { __tag / setup }
152 {
153     activate-space .bool_gset:N = \g__tag_active_space_bool,
154     activate-mc    .bool_gset:N = \g__tag_active_mc_bool,
155     activate-tree  .bool_gset:N = \g__tag_active_tree_bool,
156     activate-struct .bool_gset:N = \g__tag_active_struct_bool,
157     activate-all   .meta:n =
158         {activate-mc,activate-tree,activate-struct},
159

```

(End definition for activate-space and others. These functions are documented on page ??.)

log The log takes currently the values **none**, **v**, **vv**, **vvv**, **all**. The description of the log levels is in tagpdf-checks.

```

160     log .choice:,
161     log / none .code:n = {\int_set:Nn \l__tag_loglevel_int { 0 }},
162     log / v .code:n = {\int_set:Nn \l__tag_loglevel_int { 1 }},
163     log / vv .code:n = {\int_set:Nn \l__tag_loglevel_int { 2 }},
164     log / vvv .code:n = {\int_set:Nn \l__tag_loglevel_int { 3 }},
165     log / all .code:n = {\int_set:Nn \l__tag_loglevel_int { 10 }},

```

(End definition for log. This function is documented on page ??.)

tagunmarked This key allows to set if (in luamode) unmarked text should be marked up as artifact. The initial value is true.

```

166     tagunmarked .bool_gset:N = \g__tag_tagunmarked_bool,
167     tagunmarked .initial:n = true,

```

(End definition for tagunmarked. This function is documented on page ??.)

tabsorder This sets the tabsorder one a page. The values are **row**, **column**, **structure** (default) or **none**. Currently this is set more or less globally. More finer controll can be added if needed.

```

168     tabsorder .choice:,
169     tabsorder / row .code:n =
170         \pdfmanagement_add:nnn { Page } {Tabs}{/R},
171     tabsorder / column .code:n =
172         \pdfmanagement_add:nnn { Page } {Tabs}{/C},
173     tabsorder / structure .code:n =

```

```

174     \pdfmanagement_add:nnn { Page } {Tabs}{/S},
175     tabsorder / none       .code:n =
176     \pdfmanagement_remove:nn {Page} {Tabs},
177     tabsorder       .initial:n = structure,
178     uncompress      .code:n = { \pdf_uncompress: },
179 }

```

(End definition for tabsorder. This function is documented on page ??.)

12 loading of engine/more dependent code

```

180 \sys_if_engine luatex:T
181 {
182     \file_input:n {tagpdf-luatex.def}
183 }
184 </package>
185 <*mcloading>
186 \bool_if:NTF \g__tag_mode_lua_bool
187 {
188     \RequirePackage {tagpdf-mc-code-lua}
189 }
190 {
191     \RequirePackage {tagpdf-mc-code-generic} %
192 }
193 </mcloading>

```

Part I

The tagpdf-checks module

Messages and check code

Part of the tagpdf package

1 Commands

`\tag_if_active_p:` ★ This command tests if tagging is active. It only gives true if all tagging has been activated, `\tag_if_active:` *TF* ★ *and* if tagging hasn't been stopped locally.

`\tag_get:n` ★ `\tag_get:n{<keyword>}`

This is a generic command to retrieve data. Currently the only sensible values for the argument *<keyword>* are `mc_tag` and `struct_tag`.

2 Description of log messages

2.1 \ShowTagging command

Argument	type	note
<code>\ShowTaggingmc-data = num</code>	log+term	lua-only
<code>\ShowTaggingmc-current</code>	log+term	
<code>\ShowTaggingstruck-stack= [log show]</code>	log or term+stop	

2.2 Messages in checks and commands

command	message	action
<code>\@@_check_structure_has_tag:n</code>	struct-missing-tag	error
<code>\@@_check_structure_tag:N</code>	role-unknown-tag	warning
<code>\@@_check_info_closing_struct:n</code>	struct-show-closing	info
<code>\@@_check_no_open_struct:</code>	struct-faulty-nesting	error
<code>\@@_check_struct_used:n</code>	struct-used-twice	warning
<code>\@@_check_add_tag_role:nn</code>	role-missing, role-tag, role-unknown	warning, info (>0), warning
<code>\@@_check_mc_if_nested:</code>	mc-nested	warning
<code>\@@_check_mc_if_open:</code>	mc-not-open	warning
<code>\@@_check_mc_pushed_popped:nn</code>	mc-pushed, mc-popped	info (2), info+seq_log (>2)
<code>\@@_check_mc_tag:N</code>	mc-tag-missing, role-unknown-tag	error (missing), warning (unknown).
<code>\@@_check_mc_used:n</code>	mc-used-twice	warning

2.3 Warning messages from the lua-code

The messages are triggered if the log-level is at least equal to the number.

message	log-level	remark
WARN TAG-NOT-TAGGED:	1	
WARN TAG-OPEN-MC:	1	
WARN SHIPOUT-MC-OPEN:	1	
WARN SHIPOUT-UPS:	0	shouldn't happen
WARN TEX-MC-INSERT-MISSING:	0	shouldn't happen
WARN TEX-MC-INSERT-NO-KIDS:	2	e.g. from empty hbox

2.4 Info messages from the lua-code

The messages are triggered if the log-level is at least equal to the number. **TAG** messages are from the traversing function, **TEX** from code used in the tagpdf-mc module. **PARENTTREE** is the code building the parenttree.

3 Messages

3.1 Messages related to mc-chunks

mc-nested This message is issued if a mc is opened before the previous has been closed. This is not relevant for luamode, as the attributes don't care about this. It is used in the `\@@_check_mc_if_nested`: test.

```

6 <*package>
7 \msg_new:nnn { tag } {mc-nested} { nested-marked-content-found--mcid-#1 }

```

(End definition for mc-nested. This function is documented on page ??.)

mc-tag-missing If the tag is missing

```

8 \msg_new:nnn { tag } {mc-tag-missing} { required-tag-missing--mcid-#1 }

```

(End definition for mc-tag-missing. This function is documented on page ??.)

mc-label-unknown If the label of a mc that is used in another place is not known (yet) or has been undefined as the mc was already used.

```

9 \msg_new:nnn { tag } {mc-label-unknown}
10 { label-#1-unknown-or-has-been-already-used.\
11   Either~rerun~or~remove~one~of~the~uses. }

```

(End definition for mc-label-unknown. This function is documented on page ??.)

mc-used-twice An mc-chunk can be inserted only in one structure. This indicates wrong coding and so should at least give a warning.

```

12 \msg_new:nnn { tag } {mc-used-twice} { mc-#1-has-been-already-used }

```

(End definition for mc-used-twice. This function is documented on page ??.)

mc-not-open This is issued if a `\tag_mc_end`: is issued wrongly, wrong coding.

```

13 \msg_new:nnn { tag } {mc-not-open} { there-is-no-mc-to-end-at-#1 }

```

(End definition for mc-not-open. This function is documented on page ??.)

mc-pushed Informational messages about mc-pushing.

```

14 \msg_new:nnn { tag } {mc-pushed} { #1-has-been-pushed-to-the-mc-stack}
15 \msg_new:nnn { tag } {mc-popped} { #1-has-been-removed-from-the-mc-stack }

```

(End definition for mc-pushed and mc-popped. These functions are documented on page ??.)

mc-current Informational messages about current mc state.

```
16 \msg_new:nnn { tag } {mc-current}  
17 { current-MC:~  
18   \bool_if:NTF\g__tag_in_mc_bool  
19     {abscnt=\__tag_get_mc_abs_cnt:~,~tag=\g__tag_mc_key_tag_tl}  
20     {no-MC~open,~current-abscnt=\__tag_get_mc_abs_cnt:"}  
21 }
```

(End definition for mc-current. This function is documented on page 25.)

3.2 Messages related to mc-chunks

struct-no-objnum Should not happen ...

```
22 \msg_new:nnn { tag } {struct-no-objnum} { objnum-missing-for-structure~#1 }
```

(End definition for struct-no-objnum. This function is documented on page ??.)

struct-faulty-nesting This indicates that there is somewhere one \tag_struct_end: too much. This should be normally an error.

```
23 \msg_new:nnn { tag }  
24 {struct-faulty-nesting}  
25 { there-is-no-open-structure-on-the-stack }
```

(End definition for struct-faulty-nesting. This function is documented on page ??.)

struct-missing-tag A structure must have a tag.

```
26 \msg_new:nnn { tag } {struct-missing-tag} { a-structure-must-have-a-tag! }
```

(End definition for struct-missing-tag. This function is documented on page ??.)

struct-used-twice

```
27 \msg_new:nnn { tag } {struct-used-twice}  
28 { structure-with-label~#1-has-already-been-used}
```

(End definition for struct-used-twice. This function is documented on page ??.)

struct-label-unknown label is unknown, typically needs a rerun.

```
29 \msg_new:nnn { tag } {struct-label-unknown}  
30 { structure-with-label~#1-is-unknown-rerun}
```

(End definition for struct-label-unknown. This function is documented on page ??.)

struct-show-closing Informational message shown if log-mode is high enough

```
31 \msg_new:nnn { tag } {struct-show-closing}  
32 { closing-structure~#1-tagged-\prop_item:cn{g__tag_struct_#1_prop}{S} }
```

(End definition for struct-show-closing. This function is documented on page ??.)

3.3 Attributes

Not much yet, as attributes aren't used so much.

attr-unknown

```
33 \msg_new:nnn { tag } {attr-unknown} { attribute~#1-is-unknown}
```

(End definition for attr-unknown. This function is documented on page ??.)

3.4 Roles

`role-missing` Warning message if either the tag or the role is missing

`role-unknown` `34 \msg_new:nnn { tag } {role-missing} { tag~#1~has~no~role~assigned }`

`role-unknown-tag` `35 \msg_new:nnn { tag } {role-unknown} { role~#1~is~not~known }`

`36 \msg_new:nnn { tag } {role-unknown-tag} { tag~#1~is~not~known }`

(End definition for role-missing, role-unknown, and role-unknown-tag. These functions are documented on page ??.)

`role-tag` Info messages.

`new-tag` `37 \msg_new:nnn { tag } {role-tag} { mapping~tag~#1~to~role~#2 }`

`38 \msg_new:nnn { tag } {new-tag} { adding~new~tag~#1 }`

(End definition for role-tag and new-tag. These functions are documented on page ??.)

3.5 Miscellaneous

`tree-mcid-index-wrong` Used in the tree code, typically indicates the document must be rerun.

`39 \msg_new:nnn { tag } {tree-mcid-index-wrong}`

`40 {something-is-wrong-with-the-mcid--rerun}`

(End definition for tree-mcid-index-wrong. This function is documented on page ??.)

`sys-no-interwordspace` Currently only pdf_lat_ex and lua_lat_ex have some support for real spaces.

`41 \msg_new:nnn { tag } {sys-no-interwordspace}`

`42 {engine/output~mode~#1~doesn't~support~the~interword~spaces}`

(End definition for sys-no-interwordspace. This function is documented on page ??.)

4 Retrieving data

`\tag_get:n` This retrieves some data. This is a generic command to retrieve data. Currently the only sensible values for the argument are `mc_tag` and `struct_tag`.

`43 \cs_new:Npn \tag_get:n #1 { \use:c {__tag_get_data_#1:} }`

(End definition for \tag_get:n. This function is documented on page 13.)

5 User conditionals

`\tag_if_active_p:` This is a test if tagging is active. This allows packages to add conditional code. The test is true if all booleans, the global and the two local one are true.

`\tag_if_active:TF`

`44 \prg_new_conditional:Npnn \tag_if_active: { p , T , TF , F }`

`45 {`

`46 \bool_lazy_all:nTF`

`47 {`

`48 {\g__tag_active_struct_bool}`

`49 {\g__tag_active_mc_bool}`

`50 {\g__tag_active_tree_bool}`

`51 {\l__tag_active_struct_bool}`

`52 {\l__tag_active_mc_bool}`

`53 }`

```

54     {
55         \prg_return_true:
56     }
57     {
58         \prg_return_false:
59     }
60 }

```

(End definition for `\tag_if_active:TF`. This function is documented on page 13.)

6 Internal checks

These are checks used in various places in the code.

6.1 checks for active tagging

```

\__tag_check_if_active_mc:TF Structures must have a tag, so we check if the S entry is in the property. It is an error if
\__tag_check_if_active_struct:TF this is missing. The argument is a number.
61 \prg_new_conditional:Npnn \__tag_check_if_active_mc: {T,F,TF}
62 {
63     \bool_lazy_and:nnTF { \g__tag_active_mc_bool } { \l__tag_active_mc_bool }
64     {
65         \prg_return_true:
66     }
67     {
68         \prg_return_false:
69     }
70 }
71 \prg_new_conditional:Npnn \__tag_check_if_active_struct: {T,F,TF}
72 {
73     \bool_lazy_and:nnTF { \g__tag_active_struct_bool } { \l__tag_active_struct_bool }
74     {
75         \prg_return_true:
76     }
77     {
78         \prg_return_false:
79     }
80 }

```

(End definition for `__tag_check_if_active_mc:TF` and `__tag_check_if_active_struct:TF`.)

6.2 Checks related to structures

```

\__tag_check_structure_has_tag:n Structures must have a tag, so we check if the S entry is in the property. It is an error if
this is missing. The argument is a number. The tests for existence and type is split in
structures, as the tags are stored differently to the mc case.
81 \cs_new_protected:Npn \__tag_check_structure_has_tag:n #1 %#1 struct num
82 {
83     \prop_if_in:cnF { g__tag_struct_#1_prop }
84     {S}
85     {
86         \msg_error:nn { tag } {struct-missing-tag}

```

```

87     }
88 }

```

(End definition for `_tag_check_structure_has_tag:n`.)

`_tag_check_structure_tag:N` This checks if the name of the tag is known, either because it is a standard type or has been rolemapped.

```

89 \cs_new_protected:Npn \_tag\_check\_structure\_tag:N #1
90 {
91   \prop_if_in:Nof \g\_tag\_role\_tags\_prop {#1}
92   {
93     \msg_warning:nxx { tag } {role-unknown-tag} {#1}
94   }
95 }

```

(End definition for `_tag_check_structure_tag:N`.)

`_tag_check_info_closing_struct:n` This info message is issued at a closing structure, the use should be guarded by log-level.

```

96 \cs_new_protected:Npn \_tag\_check\_info\_closing\_struct:n #1 % #1 struct num
97 {
98   \int_compare:nNtT {\l\_tag\_loglevel\_int} > { 0 }
99   {
100     \msg_info:nnn { tag } {struct-show-closing} {#1}
101   }
102 }

```

103

```

104 \cs_generate_variant:Nn \_tag\_check\_info\_closing\_struct:n {o,x}

```

(End definition for `_tag_check_info_closing_struct:n`.)

`_tag_check_no_open_struct:` This checks if there is an open structure. It should be used when trying to close a structure. It errors if false.

```

105 \cs_new_protected:Npn \_tag\_check\_no\_open\_struct:
106 {
107   \msg_error:nn { tag } {struct-faulty-nesting}
108 }

```

(End definition for `_tag_check_no_open_struct:`.)

`_tag_check_struct_used:n` This checks if a stashed structure has already been used.

```

109 \cs_new_protected:Npn \_tag\_check\_struct\_used:n #1 % #1 label
110 {
111   \prop_get:cnNT
112     {g\_tag\_struct\_\_tag\_ref\_value:enn{tagpdfstruct-#1}{tagstruct}{unknown}_prop}
113     {P}
114     \l\_tmpa\_tl
115     {
116       \msg_warning:nnn { tag } {struct-used-twice} {#1}
117     }
118 }

```

(End definition for `_tag_check_struct_used:n`.)

6.3 Checks related to roles

`__tag_check_add_tag_role:nn` This check is used when defining a new role mapping.

```

119 \cs_new_protected:Npn \__tag_check_add_tag_role:nn #1 #2 %#1 tag, #2 role
120 {
121   \tl_if_empty:nTF {#2}
122   {
123     \msg_warning:nnn { tag } {role-missing} {#1}
124   }
125   {
126     \prop_get:NnNTF \g__tag_role_tags_prop {#2} \l_tmpa_tl
127     {
128       \int_compare:nNnT {\l__tag_loglevel_int} > { 0 }
129       {
130         \msg_info:nnnn { tag } {role-tag} {#1} {#2}
131       }
132     }
133     {
134       \msg_warning:nnn { tag } {role-unknown} {#2}
135     }
136   }
137 }

```

(End definition for __tag_check_add_tag_role:nn.)

6.4 Check related to mc-chunks

`__tag_check_mc_if_nested:` Two tests if a mc is currently open. One for the true (for begin code), one for the false part (for end code).

```

138 \cs_new_protected:Npn \__tag_check_mc_if_nested:
139 {
140   \__tag_mc_if_in:T
141   {
142     \msg_warning:nnx { tag } {mc-nested} { \__tag_get_mc_abs_cnt: }
143   }
144 }
145
146 \cs_new_protected:Npn \__tag_check_mc_if_open:
147 {
148   \__tag_mc_if_in:F
149   {
150     \msg_warning:nnx { tag } {mc-not-open} { \__tag_get_mc_abs_cnt: }
151   }
152 }

```

(End definition for __tag_check_mc_if_nested: and __tag_check_mc_if_open:.)

`__tag_check_mc_pushed_popped:nn` This creates an information message if mc's are pushed or popped. The first argument is a word (pushed or popped), the second the tag name. With larger log-level the stack is shown too.

```

153 \cs_new_protected:Npn \__tag_check_mc_pushed_popped:nn #1 #2
154 {
155   \int_compare:nNnT
156   { \l__tag_loglevel_int } = { 2 }

```

```

157     { \msg_info:nxx {tag}{mc-#1}{#2} }
158 \int_compare:nNtT
159 { \l__tag_loglevel_int } > { 2 }
160 {
161     \msg_info:nxx {tag}{mc-#1}{#2}
162     \seq_log:N \g__tag_mc_stack_seq
163 }
164 }

```

(End definition for __tag_check_mc_pushed_popped:nn.)

__tag_check_mc_tag:N This checks if the mc has a (known) tag.

```

165 \cs_new_protected:Npn \__tag_check_mc_tag:N #1  %#1 is var with a tag name in it
166 {
167     \tl_if_empty:NT #1
168     {
169         \msg_error:nxx { tag } {mc-tag-missing} { \__tag_get_mc_abs_cnt: }
170     }
171     \prop_if_in:Nof \g__tag_role_tags_NS_prop {#1}
172     {
173         \msg_warning:nxx { tag } {role-unknown-tag} {#1}
174     }
175 }

```

(End definition for __tag_check_mc_tag:N.)

\g__tag_check_mc_used_intarray This variable holds the list of used mc numbers. Everytime we store a mc-number we will add one the relevant array index. If everything is right at the end there should be only 1 until the max count of the mcid. 2 indicates that one mcid was used twice, 0 that we lost one. In engines other than luatex the total number of all intarray entries are restricted so we use only a rather small value of 65536, and we initialize the array only at first used, guarded by the log-level. This check is probably only needed for debugging. TODO does this really make sense to check? When can it happen??

```

176 \cs_new_protected:Npn \__tag_check_init_mc_used:
177 {
178     \intarray_new:Nn \g__tag_check_mc_used_intarray { 65536 }
179     \cs_gset_eq:NN \__tag_check_init_mc_used: \prg_do_nothing:
180 }

```

(End definition for \g__tag_check_mc_used_intarray and __tag_check_init_mc_used:.)

__tag_check_mc_used:n This checks if a mc is used twice.

```

181 \cs_new_protected:Npn \__tag_check_mc_used:n #1  %#1 mcid abs cnt
182 {
183     \int_compare:nNtT { \l__tag_loglevel_int } > { 2 }
184     {
185         \__tag_check_init_mc_used:
186         \intarray_gset:Nnn \g__tag_check_mc_used_intarray
187             {#1}
188             { \intarray_item:Nn \g__tag_check_mc_used_intarray {#1} + 1 }
189         \int_compare:nNtT
190         {
191             \intarray_item:Nn \g__tag_check_mc_used_intarray {#1}
192         }

```

```

193         >
194         { 1 }
195         {
196             \msg_warning:nnn { tag } {mc-used-twice} {#1}
197         }
198     }
199 }

```

(End definition for _tag_check_mc_used:n.)

_tag_check_show_MCID_by_page: This allows to show the mc on a page. Currently unused.

```

200 \cs_new_protected:Npn \_tag\_check\_show\_MCID\_by\_page:
201 {
202     \tl_set:Nx \l__tag_tmpa_tl

```

Part II

The **tagpdf-user** module

Code related to L^AT_EX2e user commands and document commands

Part of the tagpdf package

1 Setup commands

<code>\tagpdfsetup</code>	<code>\tagpdfsetup{⟨key val list⟩}</code>
---------------------------	-------------------------------------------

This is the main setup command to adapt the behaviour of tagpdf. It can be used in the preamble and in the document (but not all keys make sense there).

2 Commands related to mc-chunks

<code>\tagmcbegin</code>	<code>\tagmcbegin {⟨key-val⟩}</code>
<code>\tagmcend</code>	<code>\tagmcend</code>
<code>\tagmcuse</code>	<code>\tagmcuse{⟨label⟩}</code>

These are wrappers around `\tag_mc_begin:n`, `\tag_mc_end:` and `\tag_mc_use:n`. The commands and their argument are documented in the tagpdf-mc module. In difference to the expl3 commands, `\tagmcbegin` issues also an `\ignorespaces`, and `\tagmcend` will issue in horizontal mode an `\unskip`.

<code>\tagmcifin</code>	<code>\tagmcifin {⟨true code⟩}{⟨false code⟩}</code>
-------------------------	-----------------------------------------------------

This is a wrapper around `\tag_mc_if_in:TF` and tests if an mc is open or not. It is mostly of importance for pdf_lat_ex as lua_lat_ex doesn't mind much if a mc tag is not correctly closed. Unlike the expl3 command it is not expandable.

The command is probably not of much use and will perhaps disappear in future versions. It normally makes more sense to push/pop an mc-chunk.

3 Commands related to structures

<code>\tagstructbegin</code>	<code>\tagstructbegin {⟨key-val⟩}</code>
<code>\tagstructend</code>	<code>\tagstructend</code>
<code>\tagstructuse</code>	<code>\tagstructuse{⟨label⟩}</code>

These are direct wrappers around `\tag_struct_begin:n`, `\tag_struct_end:` and `\tag_struct_use:n`. The commands and their argument are documented in the tagpdf-struct module.

4 Debugging

\ShowTagging \ShowTagging {<key-val>}

This is a generic function to output various debugging helps. It not necessarily stops the compilation. The keys and their function are described below.

mc-data mc-data = <number>

This key is (currently?) relevant for lua mode only. It shows the data of all mc-chunks created so far. It is accurate only after shipout (and perhaps a second compilation), so typically should be issued after a newpage. The value is a positive integer and sets the first mc-shown. If no value is given, 1 is used and so all mc-chunks created so far are shown.

mc-current mc-current

This key shows the number and the tag of the currently open mc-chunk. If no chunk is open it shows only the state of the abs count. It works in all mode, but the output in luamode looks different.

struct-stack struct-stack = log|show

This key shows the current structure stack. With **log** the info is only written to the log-file, **show** stops the compilation and shows on the terminal. If no value is used, then the default is **show**.

5 Extension commands

The following commands and code parts are not core command of tagpdf. They either provide work-arounds for missing functionality elsewhere, or do a first step to apply tagpdf commands to document commands.

The commands and keys should be view as experimental!

This part will be regularly revisited to check if the code should go to a better place or can be improved and so can change easily.

5.1 Fake space

\pdffakespace (lua-only) This provides a lua-version of the **\pdffakespace** primitive of pdftex.

5.2 Paratagging

This is a first try to make use of the new paragraph hooks in a current LaTeX to automate the tagging of paragraph. It requires sane paragraph nesting, faulty code, e.g. a missing **\par** at the end of a low-level vbox can highly confuse the tagging. The tags should be carefully checked if this is used.

```
paratagging      paratagging = true|false
paratagging-show paratagging-show = true|false
```

This keys can be used in `\tagpdfsetup` and enable/disable paratagging. `paratagging-show` puts small red numbers at the begin and end of a paragraph. This is meant as a debugging help. The number are boxes and have a (tiny) height, so they can affect typesetting.

```
\tagpdfparaOn  These commands allow to enable/disable para tagging too and are a bit faster then
\tagpdfparaOff \tagpdfsetup. But I'm not sure if the names are good.
```

5.3 Link tagging

Links need a special structure and cross reference system. This is added through hooks of the `l3pdfannot` module and will work automatically if tagging is activated.

Links should (probably) have an alternative text in the Contents key. It is unclear which text this should be and how to get it. Currently the code simply adds the fix texts `url` and `ref`. Another text can be added by changing the dictionary value:

```
\pdfannot_dict_put:nnn
{ link/GoTo }
{ Contents }
{ (ref) }
```

6 User commands and extensions of document commands

```
1 <@@=tag>
2 <{*header>
3 \ProvidesExplPackage {tagpdf-user} {2021-06-29} {0.9}
4   {tagpdf - user commands}
5 </header>
```

7 Setup and preamble commands

```
\tagpdfsetup
6 <{*package>
7 \NewDocumentCommand \tagpdfsetup { m }
8   {
9     \keys_set:nn { __tag / setup } { #1 }
10  }
```

(End definition for `\tagpdfsetup`. This function is documented on page 24.)

8 Commands for the mc-chunks

```
\tagmcbegin
\tagmcend 11 \NewDocumentCommand \tagmcbegin { m }
\tagmcuse 12 {
```

```

13   \tag_mc_begin:n {#1}%\ignorespaces
14   }
15
16
17 \NewDocumentCommand \tagmcend { }
18 {
19   %\if_mode_horizontal: \unskip \fi: %
20   \tag_mc_end:
21 }
22
23 \NewDocumentCommand \tagmcuse { m }
24 {
25   \tag_mc_use:n {#1}
26 }
27

```

(End definition for `\tagmcbegin`, `\tagmcend`, and `\tagmcuse`. These functions are documented on page 24.)

`\tagmcifinTF` This is a wrapper around `\tag_mc_if_in:` and tests if an mc is open or not. It is mostly of importance for pdf_latex as lua_latex doesn't mind much if a mc tag is not correctly closed. Unlike the expl3 command it is not expandable.

```

28 \NewDocumentCommand \tagmcifinTF { m m }
29 {
30   \tag_mc_if_in:TF { #1 } { #2 }
31 }

```

(End definition for `\tagmcifinTF`. This function is documented on page ??.)

9 Commands for the structure

`\tagstructbegin` `\tagstructend` `\tagstructuse` These are structure related user commands. There are direct wrapper around the expl3 variants.

```

32 \NewDocumentCommand \tagstructbegin { m }
33 {
34   \tag_struct_begin:n {#1}
35 }
36
37 \NewDocumentCommand \tagstructend { }
38 {
39   \tag_struct_end:
40 }
41
42 \NewDocumentCommand \tagstructuse { m }
43 {
44   \tag_struct_use:n {#1}
45 }

```

(End definition for `\tagstructbegin`, `\tagstructend`, and `\tagstructuse`. These functions are documented on page 24.)

`\tagpdfifluatexTF` I should deprecate them ...

```

\tagpdfifluatexT 46 \cs_set_eq:NN\tagpdfifluatexTF \sys_if_engine luatex:TF
\tagpdfifpdfltexTF 47 \cs_set_eq:NN\tagpdfifluatexT \sys_if_engine luatex:T
48 \cs_set_eq:NN\tagpdfifpdfltexT \sys_if_engine pdfltex:T

```

(End definition for `\tagpdfifluatexTF`, `\tagpdfifluatexT`, and `\tagpdfifpdfTeXTF`. These functions are documented on page ??.)

10 Debugging

\ShowTagging This is a generic command for various show commands. It takes a keyval list, the various keys are implemented below.

```

49 \NewDocumentCommand\ShowTagging { m }
50 {
51   \keys_set:nn { __tag / show }{ #1}
52
53 }
```

(End definition for `\ShowTagging`. This function is documented on page 25.)

mc-data This key is (currently?) relevant for lua mode only. It shows the data of all mc-chunks created so far. It is accurate only after shipout, so typically should be issued after a newpage. With the optional argument the minimal number can be set.

```

54 \keys_define:nn { __tag / show }
55 {
56   mc-data .code:n =
57   {
58     \sys_if_engine_luatex:T
59     {
60       \lua_now:e{!tx.__tag.trace.show_all_mc_data(#1,\__tag_get_mc_abs_cnt:,0)}
61     }
62   }
63   ,mc-data .default:n = 1
64 }
65
```

(End definition for `mc-data`. This function is documented on page 25.)

mc-current This shows some info about the current mc-chunk. It works in generic and lua-mode.

```

66 \keys_define:nn { __tag / show }
67 { mc-current .code:n =
68   {
69     \bool_if:NTF \g__tag_mode_lua_bool
70     {
71       \sys_if_engine_luatex:T
72       {
73         \int_compare:nNnTF
74         { -2147483647 }
75         =
76         {
77           \lua_now:e
78           {
79             tex.print
80             (tex.getattribute
81              (luatexbase.attributes.g_tag_mc_cnt_attr))
82           }
83         }
84       }
85     }
86   }
```

```

85         \lua_now:e
86         {
87             ltx.__tag.trace.log
88             (
89                 "mc-current:~no~MC~open,~current~absent
90                 =\__tag_get_mc_abs_cnt:"
91                 ,0
92             )
93             texio.write_nl("")
94         }
95     }
96     {
97         \lua_now:e
98         {
99             ltx.__tag.trace.log
100             (
101                 "mc-current:~absent=\__tag_get_mc_abs_cnt:=="
102                 ..
103                 tex.getattribute(luatexbase.attributes.g__tag_mc_cnt_attr)
104                 ..
105                 "~=>tag="
106                 ..
107                 tostring
108                 (ltx.__tag.func.get_tag_from
109                 (tex.getattribute
110                 (luatexbase.attributes.g__tag_mc_type_attr)))
111                 ..
112                 "="
113                 ..
114                 tex.getattribute
115                 (luatexbase.attributes.g__tag_mc_type_attr)
116                 ,0
117             )
118             texio.write_nl("")
119         }
120     }
121 }
122 }
123 {
124     \msg_note:nn{ tag }{ mc-current }
125 }
126 }
127 }

```

(End definition for mc-current. This function is documented on page 25.)

struct-stack

```

128 \keys_define:nn { __tag / show }
129 {
130     struct-stack .choice:
131     ,struct-stack / log .code:n = \seq_log:N \g__tag_struct_tag_stack_seq
132     ,struct-stack / show .code:n = \seq_show:N \g__tag_struct_tag_stack_seq
133     ,struct-stack .default:n = show
134 }

```

(End definition for `struct-stack`. This function is documented on page 25.)

11 Commands to extend document commands

The following commands and code parts are not core command of tagpdf. The either provide work arounds for missing functionality elsewhere, or do a first step to apply tagpdf commands to document commands. This part should be regularly revisited to check if the code should go to a better place or can be improved.

11.1 Document structure

```

\__tag_add_document_structure:n
  activate
135 \cs_new_protected:Npn \__tag_add_document_structure:n #1
136 {
137   \hook_gput_code:nnn{begindocument}{tagpdf}{\tagstructbegin{tag=#1}}
138   \hook_gput_code:nnn{tagpdf/finish/before}{tagpdf}{\tagstructend}
139 }
140 \keys_define:nn { __tag / setup}
141 {
142   activate .code:n =
143   {
144     \keys_set:nn { __tag / setup }
145     { activate-mc,activate-tree,activate-struct }
146     \__tag_add_document_structure:n {#1}
147   },
148   activate .default:n = Document
149 }

```

(End definition for `__tag_add_document_structure:n` and `activate`. This function is documented on page ??.)

11.2 Fake space

`\pdffakespace` We need a luatex variant for `\pdffakespace`. This should probably go into the kernel at some time.

```

150 \sys_if_engine luatex:T
151 {
152   \NewDocumentCommand\pdffakespace { }
153   {
154     \__tag_fakespace:
155   }
156 }

```

(End definition for `\pdffakespace`. This function is documented on page 25.)

11.3 Paratagging

The following are some simple commands to enable/disable paratagging. Probably one should add some checks if we are already in a paragraph.

`\l__tag_para_bool` At first some variables.

`\l__tag_para_show_bool` 157 `\bool_new:N \l__tag_para_bool`

`\g__tag_para_int` 158 `\bool_new:N \l__tag_para_show_bool`

159 `\int_new:N \g__tag_para_int`

(End definition for `\l__tag_para_bool`, `\l__tag_para_show_bool`, and `\g__tag_para_int`.)

paratagging These keys enable/disable locally paratagging, and the debug modus. It can affect the

paratagging-show typesetting if `paratagging-show` is used. The small numbers are boxes and they have a (small) height.

160 `\keys_define:nn { __tag / setup }`

161 `{`

162 `paratagging .bool_set:N = \l__tag_para_bool,`

163 `paratagging-show .bool_set:N = \l__tag_para_show_bool,`

164 `}`

165

(End definition for `paratagging` and `paratagging-show`. These functions are documented on page 26.)

This fills the para hooks with the needed code.

166 `\AddToHook{para/begin}`

167 `{`

168 `\int_gincr:N \g__tag_para_int`

169 `\bool_if:NT \l__tag_para_bool`

170 `{`

171 `\tag_struct_begin:n {tag=P}`

172 `\bool_if:NT \l__tag_para_show_bool`

173 `{ \tag_mc_begin:n{artifact}`

174 `\llap{\color_select:n{red}\tiny\int_use:N\g__tag_para_int\ }`

175 `\tag_mc_end:`

176 `}`

177 `\tag_mc_begin:n {tag=P}`

178 `}`

179 `}`

180 `\AddToHook{para/end}`

181 `{`

182 `\bool_if:NT \l__tag_para_bool`

183 `{`

184 `\tag_mc_end:`

185 `\bool_if:NT \l__tag_para_show_bool`

186 `{ \tag_mc_begin:n{artifact}`

187 `\rlap{\color_select:n{red}\tiny\int_use:N\g__tag_para_int}`

188 `\tag_mc_end:`

189 `}`

190 `\tag_struct_end:`

191 `}`

192 `}`

\tagpdfparaOn This two command switch para mode on and off. `\tagpdfsetup` could be used too but

\tagpdfparaOff is longer.

193 `\newcommand\tagpdfparaOn {\bool_set_true:N \l__tag_para_bool}`

194 `\newcommand\tagpdfparaOff{\bool_set_false:N \l__tag_para_bool}`

(End definition for `\tagpdfparaOn` and `\tagpdfparaOff`. These functions are documented on page 26.)

11.4 Links

We need to close and reopen mc-chunks around links. Currently we handle URI and GoTo (internal) links. Links should have an alternative text in the Contents key. It is unclear which text this should be and how to get it.

```
195 \hook_gput_code:nnn
196   {pdfannot/link/URI/before}
197   {tagpdf}
198   {
199     \tag_mc_end_push:
200     \tag_struct_begin:n { tag=Link }
201     \tag_mc_begin:n { tag=Link }
202     \pdfannot_dict_put:nnx
203       { link/URI }
204       { StructParent }
205       { \tag_struct_parent_int: }
206   }
207
208 \hook_gput_code:nnn
209   {pdfannot/link/URI/after}
210   {tagpdf}
211   {
212     \tag_struct_insert_annot:xx {\pdfannot_link_ref_last:}{\tag_struct_parent_int:}
213     \tag_mc_end:
214     \tag_struct_end:
215     \tag_mc_begin_pop:n{ }
216   }
217
218 \hook_gput_code:nnn
219   {pdfannot/link/GoTo/before}
220   {tagpdf}
221   {
222     \tag_mc_end_push:
223     \tag_struct_begin:n{tag=Link}
224     \tag_mc_begin:n{tag=Link}
225     \pdfannot_dict_put:nnx
226       { link/GoTo }
227       { StructParent }
228       { \tag_struct_parent_int: }
229   }
230
231 \hook_gput_code:nnn
232   {pdfannot/link/GoTo/after}
233   {tagpdf}
234   {
235     \tag_struct_insert_annot:xx {\pdfannot_link_ref_last:}{\tag_struct_parent_int:}
236     \tag_mc_end:
237     \tag_struct_end:
238     \tag_mc_begin_pop:n{ }
239   }
240 }
241
242 % "alternative descriptions " for PAX3. How to get better text here??
243 \pdfannot_dict_put:nnn
```

```
244 { link/URI }
245 { Contents }
246 { (url) }
247
248 \pdfannot_dict_put:nnn
249 { link/GoTo }
250 { Contents }
251 { (ref) }
252
</package>
```

Part III

The tagpdf-tree module

Commands trees and main dictionaries

Part of the tagpdf package

```
1 <@@=tag>
2 <*header>
3 \ProvidesExplPackage {tagpdf-tree-code} {2021-06-29} {0.9}
4 {part of tagpdf - code related to writing trees and dictionaries to the pdf}
5 </header>
```

1 Trees, pdfmanagement and finalization code

The code to finish the structure is in a hook. This will perhaps at the end be a kernel hook. TODO check right place for the code The pdfmanagement code is the kernel hook after shipout/lastpage so all code affecting it should be before. Objects can be written later, at least in pdf mode.

```
6 <*package>
7 \hook_gput_code:nnn{begindocument}{tagpdf}
8 {
9   \bool_if:NT \g__tag_active_tree_bool
10   {
11     \sys_if_output_pdf:TF
12     {
13       \AddToHook{enddocument/end} { \__tag_finish_structure: }
14     }
15     {
16       \AddToHook{shipout/lastpage} { \__tag_finish_structure: }
17     }
18   }
19 }
```

1.1 Catalog: MarkInfo and StructTreeRoot

The StructTreeRoot and the MarkInfo entry must be added to the catalog. We do it late so that we can win, but before the pdfmanagement hook.

```
--tag/struct/0 This is the object for the root object, the StructTreeRoot
20 \pdf_object_new:nn { __tag/struct/0 }{ dict }
(End definition for __tag/struct/0.)
21 \hook_gput_code:nnn{shipout/lastpage}{tagpdf}
22 {
23   \bool_if:NT \g__tag_active_tree_bool
24   {
25     \pdfmanagement_add:nnn { Catalog / MarkInfo } { Marked } { true }
26     \pdfmanagement_add:nnx
```

```

27         { Catalog }
28         { StructTreeRoot }
29         { \pdf_object_ref:n { __tag/struct/0 } }
30     }
31 }

```

1.2 Writing structure elements

The following commands are needed to write out the structure.

`__tag_tree_write_structtreeroot:` This writes out the root object.

```

32 \cs_new_protected:Npn \__tag_tree_write_structtreeroot:
33 {
34     \__tag_prop_gput:cnx
35     { g__tag_struct_0_prop }
36     { ParentTree }
37     { \pdf_object_ref:n { __tag/tree/parenttree } }
38     \__tag_prop_gput:cnx
39     { g__tag_struct_0_prop }
40     { RoleMap }
41     { \pdf_object_ref:n { __tag/tree/rolemap } }
42     \__tag_struct_write_obj:n { 0 }
43 }

```

(End definition for `__tag_tree_write_structtreeroot:.`)

`__tag_tree_write_structelements:` This writes out the other struct elems, the absolute number is in the counter

```

44 \cs_new_protected:Npn \__tag_tree_write_structelements:
45 {
46     \int_step_inline:nnnn {1}{1}{\c@g__tag_struct_abs_int}
47     {
48         \__tag_struct_write_obj:n { ##1 }
49     }
50 }

```

(End definition for `__tag_tree_write_structelements:.`)

1.3 ParentTree

`__tag/tree/parenttree` The object which will hold the parenttree

```

51 \pdf_object_new:nn { __tag/tree/parenttree }{ dict }

```

(End definition for `__tag/tree/parenttree.`)

The ParentTree maps numbers to objects or (if the number represents a page) to arrays of objects. The numbers refer to two distinct types of entries: page streams and real objects like annotations. The numbers must be distinct and ordered. So we rely on `abspage` for the pages and put the real objects at the end. We use a counter to have a chance to get the correct number if code is processed twice.

`\c@g__tag_parenttree_obj_int` This is a counter for the real objects. It starts at the absolute last page value. It relies on `l3ref`.

```

52 \newcounter { g__tag_parenttree_obj_int }
53 \hook_gput_code:nnn{begindocument}{tagpdf}
54 {

```

```

55 \int_gset:Nn
56 \c@g__tag_parenttree_obj_int
57 { \__tag_ref_value_lastpage:nn{abspage}{100} }
58 }

```

(End definition for \c@g__tag_parenttree_obj_int.)

We store the number/object references in a tl-var. If more structure is needed one could switch to a seq.

\g__tag_parenttree_objr_tl

```

59 \tl_new:N \g__tag_parenttree_objr_tl

```

(End definition for \g__tag_parenttree_objr_tl.)

__tag_parenttree_add_objr:nn

This command stores a StructParent number and a objref into the tl var. This is only for objects like annotations, pages are handled elsewhere.

```

60 \cs_new_protected:Npn \__tag_parenttree_add_objr:nn #1 #2 % #1 StructParent number, #2 objref
61 {
62   \tl_gput_right:Nx \g__tag_parenttree_objr_tl
63   {
64     #1 \c_space_tl #2 ^^J
65   }
66 }

```

(End definition for __tag_parenttree_add_objr:nn.)

\l__tag_parenttree_content_tl

A tl-var which will get the page related parenttree content.

```

67 \tl_new:N \l__tag_parenttree_content_tl

```

(End definition for \l__tag_parenttree_content_tl.)

__tag_tree_fill_parenttree:

This is the main command to assemble the page related entries of the parent tree. It wanders through the pages and the mcid numbers and collects all mcid of one page.

```

68
69 \cs_new_protected:Npn \__tag_tree_fill_parenttree:
70 {
71   \int_step_inline:nnnn{1}{1}{\__tag_ref_value_lastpage:nn{abspage}{-1}} %not quite clear i

123         {
124             ltx.__tag.func.output_parenttree
125             (
126                 \int_use:N\g_shipout_readonly_int
127             )
128         }
129     }
130 }

```

(End definition for __tag_tree_lua_fill_parenttree:.)

__tag_tree_write_parenttree: This combines the two parts and writes out the object. TODO should the check for lua be moved into the backend code?

```

131 \cs_new_protected:Npn \__tag_tree_write_parenttree:
132 {
133     \bool_if:NTF \g__tag_mode_lua_bool
134     {

```

```

135     \__tag_tree_lua_fill_parenttree:
136   }
137   {
138     \__tag_tree_fill_parenttree:
139   }
140   \tl_put_right:NV \l__tag_parenttree_content_tl\g__tag_parenttree_objr_tl
141   \pdf_object_write:nx { __tag/tree/parenttree }
142   {
143     /Nums\c_space_tl [\l__tag_parenttree_content_tl]
144   }
145 }

```

(End definition for __tag_tree_write_parenttree:.)

1.4 Rolemap dictionary

The Rolemap dictionary describes relations between new tags and standard types. The main part here is handled in the role module, here we only define the command which writes it to the PDF.

```

__tag/tree/rolemap At first we reserve again an object.
146 \pdf_object_new:nn { __tag/tree/rolemap }{ dict }

```

(End definition for __tag/tree/rolemap.)

```

\__tag_tree_write_rolemap: This writes out the rolemap, basically it simply pushes out the dictionary which has been
filled in the role module.
147 \cs_new_protected:Npn \__tag_tree_write_rolemap:
148   {
149     \pdf_object_write:nx { __tag/tree/rolemap }
150     {
151       \pdfdict_use:n{g__tag_role/RoleMap_dict}
152     }
153   }

```

(End definition for __tag_tree_write_rolemap:.)

1.5 Classmap dictionary

Classmap and attributes are setup in the struct module, here is only the code to write it out. It should only done if values have been used.

```

\__tag_tree_write_classmap:
154 \cs_new_protected:Npn \__tag_tree_write_classmap:
155   {
156     \tl_clear:N \l__tag_tmpa_tl
157     \seq_gremove_duplicates:N \g__tag_attr_class_used_seq
158     \seq_set_map:NNn \l__tag_tmpa_seq \g__tag_attr_class_used_seq
159     {
160       /##1\c_space_tl
161       <<
162       \prop_item:Nn
163       \g__tag_attr_entries_prop
164       {##1}

```

```

165         >>
166     }
167     \tl_set:Nx \l__tag_tmpa_tl
168     {
169         \seq_use:Nn
170         \l__tag_tmpa_seq
171         { \iow_newline: }
172     }
173     \tl_if_empty:NF
174     \l__tag_tmpa_tl
175     {
176         \pdf_object_new:nn { __tag/tree/classmap }{ dict }
177         \pdf_object_write:nx
178         { __tag/tree/classmap }
179         { \l__tag_tmpa_tl }
180         \__tag_prop_gput:cnx
181         { g__tag_struct_0_prop }
182         { ClassMap }
183         { \pdf_object_ref:n { __tag/tree/classmap } }
184     }
185 }

```

(End definition for __tag_tree_write_classmap:.)

1.6 Namespaces

Namespaces are handle in the role module, here is the code to write them out. Namespaces are only relevant for pdf2.0 but we don't care, it doesn't harm.

__tag/tree/namespaces

```

186 \pdf_object_new:nn{ __tag/tree/namespaces }{array}

```

(End definition for __tag/tree/namespaces.)

__tag_tree_write_namespaces:

```

187 \cs_new_protected:Npn \__tag_tree_write_namespaces:
188 {
189     \prop_map_inline:Nn \g__tag_role_NS_prop
190     {
191         \pdfdict_if_empty:nF {g__tag_role/RoleMapNS_##1_dict}
192         {
193             \pdf_object_write:nx {__tag/RoleMapNS/##1}
194             {
195                 \pdfdict_use:n {g__tag_role/RoleMapNS_##1_dict}
196             }
197             \pdfdict_gput:nnx{g__tag_role/RoleMapNS_##1_dict}
198             {RoleMapNS}{\pdf_object_ref:n {__tag/RoleMapNS/##1}}
199         }
200         \pdf_object_write:nx{tag/NS/##1}
201         {
202             \pdfdict_use:n {g__tag_role/RoleMapNS_##1_dict}
203         }
204     }
205     \pdf_object_write:nx {__tag/tree/namespaces}
206     {

```

```

207         \prop_map_tokens:Nn \g__tag_role_NS_prop{\use_ii:nn}
208     }
209 }

```

(End definition for __tag_tree_write_namespaces:.)

1.7 Finishing the structure

This assembles the various parts. TODO (when tabular are done or if someone requests it): IDTree

__tag_finish_structure:

```

210 \cs_new_protected:Npn \__tag_finish_structure:
211 {
212     \bool_if:NT\g__tag_active_tree_bool
213     {
214         \hook_use:n {tagpdf/finish/before}
215         \__tag_tree_write_parenttree:
216         \__tag_tree_write_rolemap:
217         \__tag_tree_write_classmap:
218         \__tag_tree_write_namespaces:
219         \__tag_tree_write_structelements: %this is rather slow!!
220         \__tag_tree_write_structtreeroot:
221     }
222 }

```

(End definition for __tag_finish_structure:.)

1.8 StructParents entry for Page

We need to add to the Page resources the StructParents entry, this is simply the absolute page number.

```

223 \hook_gput_code:nnn{begindocument}{tagpdf}
224 {
225     \bool_if:NT\g__tag_active_tree_bool
226     {
227         \hook_gput_code:nnn{shipout/before} { tagpdf/structparents }
228         {
229             \pdfmanagement_add:nnx
230             { Page }
231             { StructParents }
232             { \int_eval:n { \g_shipout_readonly_int } }
233         }
234     }
235 }
236 </package>

```

Part IV

The **tagpdf-mc-shared** module

Code related to Marked Content (mc-chunks), code shared by all modes

Part of the tagpdf package

1 Public Commands

<code>\tag_mc_begin:n</code>	<code>\tag_mc_begin:n{<key-values>}</code>
<code>\tag_mc_end:</code>	<code>\tag_mc_end:</code>

These commands insert the end code of the marked content. They don't end a group and in generic mode it doesn't matter if they are in another group as the starting commands. In generic mode both commands check if they are correctly nested and issue a warning if not.

<code>\tag_mc_use:n</code>	<code>\tag_mc_use:n{<label>}</code>
----------------------------	-------------------------------------------

These command allow to record a marked content that was stashed away before into the current structure. A marked content can be used only once – the command will issue a warning if an mc is use a second time.

<code>\tag_mc_artifact_group_begin:n</code>	<code>\tag_mc_artifact_group_begin:n {<name>}</code>
<code>\tag_mc_artifact_group_end:</code>	<code>\tag_mc_artifact_group_end:</code>

New: 2019-11-20

This command pair creates a group with an artifact marker at the begin and the end. Inside the group the tagging commands are disabled. It allows to mark a complete region as artifact without having to worry about user commands with tagging commands. `<name>` should be a value allowed also for the `artifact` key. It pushes and pops mc-chunks at the begin and end. TODO: document is in tagpdf.tex

<code>\tag_mc_end_push:</code>	<code>\tag_mc_end_push:</code>
<code>\tag_mc_begin_pop:n</code>	<code>\tag_mc_begin_pop:n{<key-values>}</code>

New: 2021-04-22

If there is an open mc chunk, `\tag_mc_end_push:` ends it and pushes its tag of the (global) stack. If there is no open chunk, it puts `-1` on the stack (for debugging) `\tag_mc_begin_pop:n` removes a value from the stack. If it is different from `-1` it opens a tag with it. The reopened mc chunk loses info like the alttext for now.

<code>\tag_mc_if_in_p: *</code>	<code>\tag_mc_if_in:TF {<true code>} {<false code>}</code>
<code>\tag_mc_if_in:TF *</code>	Determines if a mc-chunk is open.

2 Public keys

The following keys can be used with `\tag_mc_begin:n`, `\tagmcbegin`, `\tag_mc_begin_pop:n`,

<hr/> tag <hr/>	This key is required, unless artifact is used. The value is a tag like P or H1 without a slash at the begin, this is added by the code. It is possible to setup new tags. The value of the key is expanded, so it can be a command. The expansion is passed unchanged to the PDF, so it should with a starting slash give a valid PDF name (some ascii with numbers like H4 is fine).
<hr/> artifact <hr/>	This will setup the marked content as an artifact. The key should be used for content that should be ignored. The key can take one of the values pagination , layout , page , background and notype (this is the default).
<hr/> raw <hr/>	This key allows to add more entries to the properties dictionary. The value must be correct, low-level PDF. E.g. <code>raw=/Alt (Hello)</code> will insert an alternative Text.
<hr/> alttext alttext-o <hr/>	This key inserts an <code>/Alt</code> value in the property dictionary of the BDC operator. The value is handled as verbatim string, commands are not expanded. With alttext-o the value is expanded once.
<hr/> actualtext actualtext-o <hr/>	This key inserts an <code>/ActualText</code> value in the property dictionary of the BDC operator. The value is handled as verbatim string, commands are not expanded. With actualtext-o the value is expanded once.
<hr/> label <hr/>	This key sets a label by which one can call the marked content later in another structure (if it has been stashed with the stash key). Internally the label name will start with <code>tagpdf-</code> .
<hr/> stash <hr/>	<p>This “stashes” an mc-chunk: it is not inserted into the current structure. It should be normally be used along with a label to be able to use the mc-chunk in another place.</p> <p>The code is splitted into three parts: code shared by all engines, code specific to luamode and code not used by luamode.</p>

3 Marked content code – shared

```
1 <@@=tag>
2 <*header>
3 \ProvidesExplPackage {tagpdf-mc-code-shared} {2021-06-29} {0.9}
4   {part of tagpdf - code related to marking chunks -
5     code shared by generic and luamode }
6 </header>
```

3.1 Variables and counters

MC chunks must be counted. I use a latex counter for the absolute count, so that it is added to `\cl@@ckpt` and restored e.g. in tabulars and align. `\int_new:N \c@g_@@_MCID_int` and `\tl_put_right:Nn\cl@@ckpt{\@elt{g_uf_test_int}}` would work too, but as the name is not expl3 then too, why bother? The absolute counter can be used to label and to check if the page counter needs a reset.

`g__tag_MCID_abs_int`

```
7 (*shared)
8 \newcounter { g__tag_MCID_abs_int }
(End definition for g__tag_MCID_abs_int.)
```

`__tag_get_mc_abs_cnt:`

A (expandable) function to get the current value of the cnt.
`\cs_new:Npn __tag_get_mc_abs_cnt: { \int_use:N \c@g__tag_MCID_abs_int }`
(End definition for `__tag_get_mc_abs_cnt:.`)

`\g__tag_MCID_tmp_bypage_int`

The following hold the temporary by page number assigned to a mc. It must be defined in the shared code to avoid problems with labels.
`\int_new:N \g__tag_MCID_tmp_bypage_int`
(End definition for `\g__tag_MCID_tmp_bypage_int.`)

`\g__tag_mc_parenttree_prop`

For every chunk we need to know the structure it is in, to record this in the parent tree. We store this in a property.
key: absolute number of the mc (tagmcabs)
value: the structure number the mc is in
`__tag_prop_new:N \g__tag_mc_parenttree_prop`
(End definition for `\g__tag_mc_parenttree_prop.`)

`\g__tag_mc_parenttree_prop`

Some commands (e.g. links) want to close a previous mc and reopen it after they did their work. For this we create a stack:
`\seq_new:N \g__tag_mc_stack_seq`
(End definition for `\g__tag_mc_parenttree_prop.`)

`\l__tag_mc_artifact_type_tl`

Artifacts can have various types like Pagination or Layout. This stored in this variable.
`\tl_new:N \l__tag_mc_artifact_type_tl`
(End definition for `\l__tag_mc_artifact_type_tl.`)

`\l__tag_mc_key_stash_bool`

`\l__tag_mc_artifact_bool`

This booleans store the stash and artifact status of the mc-chunk.
`\bool_new:N \l__tag_mc_key_stash_bool`
`\bool_new:N \l__tag_mc_artifact_bool`
(End definition for `\l__tag_mc_key_stash_bool` and `\l__tag_mc_artifact_bool.`)

`\l__tag_mc_key_tag_tl`

`\g__tag_mc_key_tag_tl`

`\l__tag_mc_key_label_tl`

Variables used by the keys. `\l_@@_mc_key_properties_tl` will collect a number of values. TODO: should this be a pdfdict now?
`\tl_new:N \l__tag_mc_key_tag_tl`
`\tl_new:N \g__tag_mc_key_tag_tl`
`\tl_new:N \l__tag_mc_key_label_tl`
`\tl_new:N \l__tag_mc_key_properties_tl`
(End definition for `\l__tag_mc_key_tag_tl` and others.)

3.2 Functions

`_tag_mc_handle_mc_label:n` The commands labels a mc-chunk. It is used if the user explicitly labels the mc-chunk with the `label` key. The argument is the value provided by the user. It stores the attributes

`tagabspage`: the absolute page, `\g_shipout_readonly_int`,
`tagmcabs`: the absolute mc-counter `\c@g_@@_MCID_abs_int`,
`tagmcid`: the ID of the chunk on the page `\g_@@_MCID_tmp_bypage_int`, this typically settles down after a second compilation. The reference command is defined in `tagpdf.dtx` and is based on `l3ref`.

```
20 \cs_new:Nn \_tag_mc_handle_mc_label:n
21 {
22   \_tag_ref_label:en{tagpdf-#1}{mc}
23 }
```

(End definition for `_tag_mc_handle_mc_label:n`.)

`_tag_mc_set_label_used:n` Unlike with structures we can't check if a labeled mc has been used by looking at the `P` key, so we use a dedicated `cname` for the test

```
24 \cs_new_protected:Npn \_tag_mc_set_label_used:n #1 %#1 labelname
25 {
26   \tl_new:c { g__tag_mc_label_\tl_to_str:n{#1}_used_tl }
27 }
```

(End definition for `_tag_mc_set_label_used:n`.)

`\tag_mc_use:n` These command allow to record a marked content that was stashed away before into the current structure. A marked content can be used only once – the command will issue a warning if an mc is use a second time. The argument is a label name set with the `label` key.

TODO: is testing for struct the right test?

```
28 \cs_new_protected:Npn \tag_mc_use:n #1 %#1: label name
29 {
30   \_tag_check_if_active_struct:T
31   {
32     \tl_set:Nx \l__tag_tmpa_tl { \_tag_ref_value:nnn{tagpdf-#1}{tagmcabs}{ } }
33     \tl_if_empty:NTF\l__tag_tmpa_tl
34     {
35       \msg_warning:nnn {tag} {mc-label-unknown} {#1}
36     }
37     {
38       \cs_if_free:cTF { g__tag_mc_label_\tl_to_str:n{#1}_used_tl }
39       {
40         \_tag_mc_handle_stash:x { \l__tag_tmpa_tl }
41         \_tag_mc_set_label_used:n {#1}
42       }
43       {
44         \msg_warning:nnn {tag}{mc-used-twice}{#1}
45       }
46     }
47   }
48 }
```

(End definition for `\tag_mc_use:n`. This function is documented on page 41.)

`\tag_mc_artifact_group_begin:n` This opens an artifact of the type given in the argument, and then stops all tagging. It
`\tag_mc_artifact_group_end:` creates a group. It pushes and pops mc-chunks at the begin and end.

```

49 \cs_new_protected:Npn \tag_mc_artifact_group_begin:n #1
50 {
51   \tag_mc_end_push:
52   \tag_mc_begin:n {artifact=#1}
53   \tag_stop_group_begin:
54 }
55
56 \cs_new_protected:Npn \tag_mc_artifact_group_end:
57 {
58   \tag_stop_group_end:
59   \tag_mc_end:
60   \tag_mc_begin_pop:n{ }
61 }

```

(End definition for `\tag_mc_artifact_group_begin:n` and `\tag_mc_artifact_group_end:`. These functions are documented on page 41.)

`\tag_mc_end_push:`
`\tag_mc_begin_pop:n`

```

62 \cs_new_protected:Npn \tag_mc_end_push:
63 {
64   \__tag_check_if_active_mc:T
65   {
66     \__tag_mc_if_in:TF
67     {
68       \seq_gpush:Nx \g__tag_mc_stack_seq { \tag_get:n {mc_tag} }
69       \__tag_check_mc_pushed_popped:nn
70       { pushed }
71       { \tag_get:n {mc_tag} }
72       \tag_mc_end:
73     }
74     {
75       \seq_gpush:Nn \g__tag_mc_stack_seq {-1}
76       \__tag_check_mc_pushed_popped:nn { pushed }{-1}
77     }
78   }
79 }
80
81 \cs_new_protected:Npn \tag_mc_begin_pop:n #1
82 {

128         \tl\_set:Nn \l\_tag\_mc\_artifact\_type\_tl {}
129     },
130 }

```

(End definition for stash, __artifact-bool, and __artifact-type. This function is documented on page 62.)

131 </shared>

Part V

The tagpdf-mc-generic module

Code related to Marked Content (mc-chunks), generic mode

Part of the tagpdf package

1 Marked content code – generic mode

```
1 <@@=tag>
2 <*generic>
3 \ProvidesExplPackage {tagpdf-mc-code-generic} {2021-06-29} {0.9}
4 {part of tagpdf - code related to marking chunks - generic mode}
5 </generic>
```

1.1 Variables

`\g__tag_in_mc_bool` This boolean records if a mc is open, to test nesting.

```
6 <*generic>
7 \bool_new:N \g__tag_in_mc_bool
```

(End definition for `\g__tag_in_mc_bool`.)

`\g__tag_MCID_byabspage_prop` This property will hold the current maximum on a page it will contain key-value of type `<abspagenum>=<max mcid>`

```
8 \__tag_prop_new:N \g__tag_MCID_byabspage_prop
```

(End definition for `\g__tag_MCID_byabspage_prop`.)

`\l__tag_mc_ref_abspage_tl` We need a ref-label system to ensure that the MCID cnt restarts at 0 on a new page This will be used to store the tagabspage attribute retrieved from a label.

```
9 \tl_new:N \l__tag_mc_ref_abspage_tl
```

(End definition for `\l__tag_mc_ref_abspage_tl`.)

`\l__tag_mc_tmpa_tl` temporary variable

```
10 \tl_new:N \l__tag_mc_tmpa_tl
```

(End definition for `\l__tag_mc_tmpa_tl`.)

1.2 Functions

`__tag_mc_if_in_p:` This is a test if a mc is open or not. It depends simply on a global boolean: mc-chunks are added linearly so nesting should not be relevant.

```
\__tag_mc_if_in:TF
\tag_mc_if_in_p: 11 \prg_new_conditional:Nnn \__tag_mc_if_in: {p,T,F,TF}
\tag_mc_if_in:TF 12 {
13   \bool_if:NTF \g__tag_in_mc_bool
14   { \prg_return_true: }
15   { \prg_return_false: }
16 }
```

```

17
18 \prg_new_eq_conditional:NNn \tag_mc_if_in: \__tag_mc_if_in: {p,T,F,TF}

```

(End definition for __tag_mc_if_in:TF and \tag_mc_if_in:TF. This function is documented on page 41.)

```

\__tag_mc_bmc:n
\__tag_mc_emc:
\__tag_mc_bdc:nn
\__tag_mc_bdc:nx

```

These are the low-level commands. There are now equal to the pdfmanagement commands generic mode, but we use an indirection in case luamode need something else. change 04.08.2018: the commands do not check the validity of the arguments or try to escape them, this should be done before using them.

```

19 % #1 tag, #2 properties
20 \cs_set_eq:NN \__tag_mc_bmc:n \pdf_bmc:n
21 \cs_set_eq:NN \__tag_mc_emc: \pdf_emc:
22 \cs_set_eq:NN \__tag_mc_bdc:nn \pdf_bdc:nn
23 \cs_generate_variant:Nn \__tag_mc_bdc:nn {nx}

```

(End definition for __tag_mc_bmc:n, __tag_mc_emc:, and __tag_mc_bdc:nn.)

```

\__tag_mc_bdc_mcid:nn
\__tag_mc_bdc_mcid:n
\__tag_mc_handle_mcid:nn
\__tag_mc_handle_mcid:VV

```

This create a BDC mark with an /MCID key. Most of the work here is to get the current number value for the MCID: they must be numbered by page starting with 0 and then successively. The first argument is the tag, e.g. P or Span, the second is used to pass more properties. We also define a wrapper around the low-level command as luamode will need something different.

```

199         \exp_args:Nnx
200         \keys_set:nn
201         { __tag / mc }
202         { __artifact-bool, __artifact-type=#1 }
203     },
204     artifact .default:n      = {notype}
205 }
206 </generic>

```

(End definition for tag and others. These functions are documented on page 61.)

Part VI

The **tagpdf-mc-luacode** module

Code related to Marked Content (mc-chunks), luamode-specific

Part of the tagpdf package

The code is splitted into three parts: code shared by all engines, code specific to luamode and code not used by luamode.

1 Marked content code – luamode code

luamode uses attributes to mark mc-chunks. The two attributes used are defined in the backend file. The backend also load the lua file, as it can contain functions needed elsewhere. The attributes for mc are global (between 0.6 and 0.81 they were local but this was reverted). The attributes are setup only in lua, and one should use the lua functions to set and get them.

`g_@@_mc_type_attr`: the value represent the type

`g_@@_mc_cnt_attr`: will hold the `\c@g_@@_MCID_abs_int` value

Handling attribute needs a different system to number the page wise mcid's: a `\tagmcbegin ... \tagmccend` pair no longer surrounds exactly one mc chunk: it can be split at page breaks. We know the included mcid(s) only after the shipout. So for the `struct -> mcid` mapping we need to record `struct -> mc-cnt` (in `\g_@@_mc_parenttree_prop` and/or a lua table and at shipout `mc-cnt-> {mcid, mcid, ...}` and when building the trees connect both.

Key definitions are overwritten for luatex to store that data in lua-tables. The data for the mc are in `ltx.@@.mc[absnum]`. The fields of the table are:

`tag` : the type (a string)

`raw` : more properties (string)

`label`: a string.

`artifact`: the presence indicates an artifact, the value (string) is the type.

`kids`: a array of tables

`{1={kid=num2,page=pagenum1}, 2={kid=num2,page=pagenum2},...}`,

this describes the chunks the mc has been split to by the traversing code

`parent`: the number of the structure it is in. Needed to build the parent tree.

```
1 <@@=tag>
2 <*luamode>
3 \ProvidesExplPackage {tagpdf-mc-code-lua} {2021-06-29} {0.9}
4   {tagpdf - mc code only for the luamode }
5 </luamode>
```

The main function which wanders through the shipout box to inject the literals. if the new callback is there, it is used.

```
6 <*luamode>
7 \hook_gput_code:nnn{begindocument}{tagpdf/mc}
8 {

Part VII

The **tagpdf-struct** module

Commands to create the structure

Part of the tagpdf package

1 Public Commands

<code>\tag_struct_begin:n</code>	<code>\tag_struct_begin:n{<key-values>}</code>
<code>\tag_struct_end:</code>	<code>\tag_struct_end:</code>

These commands start and end a new structure. They don't start a group. They set all their values globally.

<code>\tag_struct_use:n</code>	<code>\tag_struct_use:n{<label>}</code>
--------------------------------	-----------------------------------------------

These commands insert a structure previously stashed away as kid into the currently active structure. A structure should be used only once, if the structure already has a parent a warning is issued.

The following two functions are used to add annotations. They must be used together and with care to get the same numbers. Perhaps some improvements are needed here.

<code>\tag_struct_insert_annot:nn</code>	<code>\tag_struct_insert_annot:nn{<object reference>}{<struct parent number>}</code>
------------------------------------------	--------------------------------------------------------------------------------------------------

This inserts an annotation in the structure. *<object reference>* is there reference to the annotation. *<struct parent number>* should be the same number as had been inserted with `\tag_struct_parent_int:` as `StructParent` value to the dictionary of the annotation. The command will increase the value of the counter used by `\tag_struct_parent_int:`.

<code>\tag_struct_parent_int:</code>	<code>\tag_struct_parent_int:</code>
--------------------------------------	--------------------------------------

This gives back the next free `/StructParent` number (assuming that it is together with `\tag_struct_insert_annot:nn` which will increase the number.

2 Public keys

2.1 Keys for the structure commands

<code>tag</code>	This is required. The value of the key is normally one of the standard types listed in section ???. It is possible to setup new tags/types. The value can also be of the form <code>type/NS</code> , where <code>NS</code> is the shorthand of a declared name space. Currently the names spaces <code>pdf</code> , <code>pdf2</code> , <code>mathml</code> and <code>user</code> are defined. This allows to use a different name space than the one connected by default to the tag. But normally this should not be needed.
------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

<u>stash</u>	Normally a new structure inserts itself as a kid into the currently active structure. This key prohibits this. The structure is nevertheless from now on “the current active structure” and parent for following marked content and structures.
<u>label</u>	This key sets a label by which one can use the structure later in another structure. Internally the label name will start with <code>tagpdfstruct-</code> .
<u>title</u> <u>title-o</u>	This keys allows to set the dictionary entry <code>/Title</code> in the structure object. The value is handled as verbatim string and hex encoded. Commands are not expanded. <code>title-o</code> will expand the value once.
<u>alttext</u> <u>alttext-o</u>	This key inserts an <code>/Alt</code> value in the dictionary of structure object. The value is handled as verbatim string and hex encoded. <code>alttext-o</code> will expand the value once.
<u>actualtext</u> <u>actualtext-o</u>	This key inserts an <code>/ActualText</code> value in the dictionary of structure object. The value is handled as verbatim string and hex encoded. <code>actualtext-o</code> will expand the value once.
<u>lang</u>	This key allows to set the language for a structure element. The value should be a bcp-identifier, e.g. <code>de-De</code> .
<u>ref</u>	This key allows to add references to other structure elements, it adds the <code>/Ref</code> array to the structure. The value should be a comma separated list of structure labels set with the <code>label</code> key. e.g. <code>ref={label1,label2}</code> .
<u>E</u>	This key sets the <code>/E</code> key, the expanded form of an abbreviation or an acronym (I couldn’t think of a better name, so I stucked to E).
<u>AF</u> <u>AFinline</u> <u>AFinline-o</u>	<p><code>AF</code> = <code><object name></code> <code>AFinline</code> = <code><text content></code></p> <p>These keys allows to reference an associated file in the structure element. The value <code><object name></code> should be the name of an object pointing to the <code>/Filespec</code> dictionary as expected by <code>\pdf_object_ref:n</code> from a current <code>l3kernel</code>.</p> <p>The value <code>AF-inline</code> is some text, which is embedded in the PDF as a text file with mime type <code>text/plain</code>. <code>AF-inline-o</code> is like <code>AF-inline</code> but expands the value once.</p> <p>Future versions will perhaps extend this to more mime types, but it is still a research task to find out what is really needed.</p>

attribute This key takes as argument a comma list of attribute names (use braces to protect the commas from the external key-val parser) and allows to add one or more attribute dictionary entries in the structure object. As an example

```
\tagstructbegin{tag=TH,attribute= TH-row}
```

Attribute names and their content must be declared first in `\tagpdfsetup`.

attribute-class This key takes as argument a comma list of attribute class names (use braces to protect the commas from the external key-val parser) and allows to add one or more attribute classes to the structure object.

Attribute class names and their content must be declared first in `\tagpdfsetup`.

2.2 Setup keys

newattribute `newattribute = {\langle name \rangle}{\langle Content \rangle}`

This key can be used in the setup command `\tagpdfsetup` and allow to declare a new attribute, which can be used as attribute or attribute class. The value are two brace groups, the first contains the name, the second the content.

```
\tagpdfsetup
{
  newattribute =
    {TH-col}{/O /Table /Scope /Column},
  newattribute =
    {TH-row}{/O /Table /Scope /Row},
}

1 <@@=tag>
2 <*header>
3 \ProvidesExplPackage {tagpdf-struct-code} {2021-06-29} {0.9}
4 {part of tagpdf - code related to storing structure}
5 </header>
```

3 Variables

`\c@g__tag_struct_abs_int` Every structure will have a unique, absolute number. I will use a latex counter for the structure count to have a chance to avoid double structures in align etc.

```
6 <*package>
7 \newcounter { g__tag_struct_abs_int }
8 \int_gzero:N \c@g__tag_struct_abs_int
```

(End definition for `\c@g__tag_struct_abs_int`.)

`\g__tag_struct_objR_seq` a sequence to store mapping between the structure number and the object number. We assume that structure numbers are assign consecutively and so the index of the seq can be used. A seq allows easy mapping over the structures.

```
9 \__tag_seq_new:N \g__tag_struct_objR_seq
```

(End definition for \g__tag_struct_objR_seq.)

\g__tag_struct_stack_seq A stack sequence for the structure stack. When a sequence is opened it's number is put on the stack.

```

10 \seq_new:N      \g__tag_struct_stack_seq
11 \seq_gpush:Nn   \g__tag_struct_stack_seq {0}

```

(End definition for \g__tag_struct_stack_seq.)

\g__tag_struct_tag_stack_seq We will perhaps also need the tags. While it is possible to get them from the numbered stack, lets build a tag stack too.

```

12 \seq_new:N      \g__tag_struct_tag_stack_seq
13 \seq_gpush:Nn   \g__tag_struct_tag_stack_seq {Root}

```

(End definition for \g__tag_struct_tag_stack_seq.)

\g__tag_struct_stack_current_tl The global variable will hold the current structure number. The local temporary variable will hold the parent when we fetch it from the stack.

```

14 \tl_new:N      \g__tag_struct_stack_current_tl
15 \tl_new:N      \l__tag_struct_stack_parent_tmpa_tl

```

(End definition for \g__tag_struct_stack_current_tl and \l__tag_struct_stack_parent_tmpa_tl.)

I will need at least one structure: the StructTreeRoot normally it should have only one kid, e.g. the document element.

The data of the StructTreeRoot and the StructElem are in properties: \g_@@_struct_0_prop for the root and \g_@@_struct_N_prop, $N \geq 1$ for the other.

This creates quite a number of properties, so perhaps we will have to do this more efficiently in the future.

All properties have at least the keys

Type StructTreeRoot or StructElem

and the keys from the two following lists (the root has a special set of properties). the values of the prop should be already escaped properly when the entries are created (title,lange,alt,E,actualtext)

\c__tag_struct_StructTreeRoot_entries_seq These seq contain the keys we support in the two object types. They are currently no longer used, but are provided as documentation and for potential future checks. They should be adapted if there are changes in the PDF format.

```

16 \seq_const_from_clist:Nn \c__tag_struct_StructTreeRoot_entries_seq
17   {%p. 857/858
18     Type,                % always /StructTreeRoot
19     K,                   % kid, dictionary or array of dictionaries
20     IDTree,              % currently unused
21     ParentTree,          % required,obj ref to the parent tree
22     ParentTreeNextKey,   % optional
23     RoleMap,
24     ClassMap,
25     Namespaces
26   }
27
28 \seq_const_from_clist:Nn \c__tag_struct_StructElem_entries_seq
29   {%p 858 f
30     Type,                %always /StructElem

```

```

31     S,                %tag/type
32     P,                %parent
33     ID,               %optional
34     Ref,              %optional, pdf 2.0 Use?
35     Pg,               %obj num of starting page, optional
36     K,                %kids
37     A,                %attributes, probably unused
38     C,                %class ""
39     %R,               %attribute revision number, irrelevant for us as we
40                      % don't update/change existing PDF and (probably)
41                      % deprecated in PDF 2.0
42     T,                %title, value in () or <>
43     Lang,             %language
44     Alt,              % value in () or <>
45     E,                % abbreviation
46     ActualText,
47     AF,               %pdf 2.0, array of dict, associated files
48     NS,               %pdf 2.0, dict, namespace
49     PhoneticAlphabet, %pdf 2.0
50     Phoneme           %pdf 2.0
51 }

```

(End definition for \c__tag_struct_StructTreeRoot_entries_seq and \c__tag_struct_StructElem_entries_seq.)

3.1 Variables used by the keys

\g__tag_struct_tag_tl Use by the tag key to store the tag and the namespace.

```

\g__tag_struct_tag_NS_tl 52 \tl_new:N \g__tag_struct_tag_tl
53 \tl_new:N \g__tag_struct_tag_NS_tl

```

(End definition for \g__tag_struct_tag_tl and \g__tag_struct_tag_NS_tl.)

\l__tag_struct_key_label_tl This will hold the label value.

```

54 \tl_new:N \l__tag_struct_key_label_tl

```

(End definition for \l__tag_struct_key_label_tl.)

\l__tag_struct_elem_stash_bool This will keep track of the stash status

```

55 \bool_new:N \l__tag_struct_elem_stash_bool

```

(End definition for \l__tag_struct_elem_stash_bool.)

4 Commands

The properties must be in some places handled expandably. So I need an output handler for each prop, to get expandable output see <https://tex.stackexchange.com/questions/424208>. There is probably room here for a more efficient implementation. TODO check if this can now be implemented with the pdfdict commands. The property contains currently non pdf keys, but e.g. object numbers are perhaps no longer needed as we have named object anyway.

```

__tag_struct_output_prop_aux:nn
__tag_new_output_prop_handler:n
56 \cs_new:Npn \__tag_struct_output_prop_aux:nn #1 #2 %#1 num, #2 key
57 {
58   \prop_if_in:cnT
59     { g__tag_struct_#1_prop }
60     { #2 }
61     {
62       \c_space_tl/#2~ \prop_item:cn{ g__tag_struct_#1_prop } { #2 }
63     }
64 }
65
66 \cs_new_protected:Npn \__tag_new_output_prop_handler:n #1
67 {
68   \cs_new:cn { __tag_struct_output_prop_#1:n }
69   {
70     \__tag_struct_output_prop_aux:nn {#1}{##1}
71   }
72 }

(End definition for \__tag_struct_output_prop_aux:nn and \__tag_new_output_prop_handler:n.)

```

4.1 Initialization of the StructTreeRoot

The first structure element, the StructTreeRoot is special, so created manually. The underlying object is @@/struct/0 which is currently created in the tree code (TODO move it here). The ParentTree and RoleMap entries are added at begin document in the tree code as they refer to object which are setup in other parts of the code. This avoid timing issues.

```

73 \tl_gset:Nn \g__tag_struct_stack_current_tl {0}

g__tag_struct_0_prop
g__tag_struct_kids_0_seq
74 \__tag_prop_new:c { g__tag_struct_0_prop }
75 \__tag_new_output_prop_handler:n {0}
76 \__tag_seq_new:c { g__tag_struct_kids_0_seq }
77
78 \__tag_prop_gput:cnn
79 { g__tag_struct_0_prop }
80 { Type }
81 { /StructTreeRoot }
82
83
84

```

Namespaces are pdf 2.0 but it doesn't harm to have an empty entry. We could add a test, but if the code moves into the kernel, timing could get tricky.

```

85 \__tag_prop_gput:cnx
86 { g__tag_struct_0_prop }
87 { Namespaces }
88 { \pdf_object_ref:n { __tag/tree/namespaces } }

(End definition for g__tag_struct_0_prop and g__tag_struct_kids_0_seq.)

```

4.2 Handlings kids

Commands to store the kids. Kids in a structure can be a reference to a mc-chunk, an object reference to another structure element, or a object reference to an annotation (through an OBJR object).

`_tag_struct_kid_mc_gput_right:nn`

The command to store an mc-chunk, this is a dictionary of type MCR. It would be possible to write out the content directly as unnamed object and to store only the object reference, but probably this would be slower, and the PDF is more readable like this. The code doesn't try to avoid the use of the /Pg key by checking page numbers. That imho only slows down without much gain.

```

89 \cs_new_protected:Npn \_tag_struct_kid_mc_gput_right:nn #1 #2 %#1 structure num, #2 MCID abs
90 {
91   \_tag_seq_gput_right:cx
92   { g\_tag_struct_kids_#1_seq }
93   {
94     <<
95     /Type \c_space_tl /MCR \c_space_tl
96     /Pg
97     \c_space_tl
98     \pdf_pageobject_ref:n { \_tag_ref_value:enn{mcid-#2}{tagabspage}{1} }
99     /MCID \c_space_tl \_tag_ref_value:enn{mcid-#2}{tagmcid}{1}
100    >>
101   }
102 }
```

(End definition for `_tag_struct_kid_mc_gput_right:nn`.)

`_tag_struct_kid_struct_gput_right:nn`

This commands adds a structure as kid. We only need to record the object reference in the sequence.

`_tag_struct_kid_struct_gput_right:xx`

```

103 \cs_new_protected:Npn \_tag_struct_kid_struct_gput_right:nn #1 #2 %#1 num of parent struct, #
104 {
105   \_tag_seq_gput_right:cx
106   { g\_tag_struct_kids_#1_seq }
107   {
108     \pdf_object_ref:n { \_tag/struct/#2 }
109   }
110 }
```

`\cs_generate_variant:Nn _tag_struct_kid_struct_gput_right:nn {xx}`

(End definition for `_tag_struct_kid_struct_gput_right:nn`.)

`_tag_struct_kid_OBJR_gput_right:nn`

At last the command to add an OBJR object. This has to write an object first. The first argument is the number of the parent structure, the second the (expanded) object reference of the annotation.

`_tag_struct_kid_OBJR_gput_right:xx`

```

113 \cs_new_protected:Npn \_tag_struct_kid_OBJR_gput_right:nn #1 #2 %#1 num of parent struct,
114                                     %#2 obj reference
115 {
116   \pdf_object_unnamed_write:nn
117   { dict }
118   {
119     /Type/OBJR/Obj-#2
120   }
```

```

121     \__tag_seq_gput_right:cx
122     { g__tag_struct_kids_#1_seq }
123     {
124         \pdf_object_ref_last:
125     }
126 }
127
128 \cs_generate_variant:Nn\__tag_struct_kid_OBJR_gput_right:nn { xx }
129

```

(End definition for __tag_struct_kid_OBJR_gput_right:nn.)

__tag_struct_exchange_kid_command:N
__tag_struct_exchange_kid_command:c

In luamode it can happen that a single kid in a structure is split at a page break into two or more mcid. In this case the lua code has to convert put the dictionary of the kid into an array. See issue 13 at tagpdf repo. We exchange the dummy command for the kids to mark this case.

```

130 \cs_new_protected:Npn\__tag_struct_exchange_kid_command:N #1 %#1 = seq var
131 {
132     \seq_gpop_left:NN #1 \l__tag_tmpa_tl
133     \regex_replace_once:nnN
134     { \c{\__tag_mc_insert_mcid_kids:n} }
135     { \c{\__tag_mc_insert_mcid_single_kids:n} }
136     \l__tag_tmpa_tl
137     \seq_gput_left:NV #1 \l__tag_tmpa_tl
138 }
139
140 \cs_generate_variant:Nn\__tag_struct_exchange_kid_command:N { c }

```

(End definition for __tag_struct_exchange_kid_command:N.)

__tag_struct_fill_kid_key:n

This command adds the kid info to the K entry. In lua mode the content contains commands which are expanded later. The argument is the structure number.

```

141 \cs_new_protected:Npn \__tag_struct_fill_kid_key:n #1 %#1 is the struct num
142 {
143     \int_case:nnF
144     {
145         \seq_count:c
146         {
147             g__tag_struct_kids_#1_seq
148         }
149     }
150     {
151         { 0 }
152         { } %no kids, do nothing
153         { 1 } % 1 kid, insert
154         {
155             % in this case we need a special command in
156             % luamode to get the array right. See issue #13
157             \bool_if:NT\g__tag_mode_lua_bool
158             {
159                 \__tag_struct_exchange_kid_command:c
160                 {g__tag_struct_kids_#1_seq}
161             }
162             \__tag_prop_gput:cnx { g__tag_struct_#1_prop } {K}

```

```

163         {
164             \seq_item:cn
165             {
166                 g__tag_struct_kids_#1_seq
167             }
168             {1}
169         }
170     } %
171 }
172 { %many kids, use an array
173     \__tag_prop_gput:cnx { g__tag_struct_#1_prop } {K}
174     {
175         [
176             \seq_use:cn
177             {
178                 g__tag_struct_kids_#1_seq
179             }
180             {
181                 \c_space_tl
182             }
183         ]
184     }
185 }
186 }
187

```

(End definition for __tag_struct_fill_kid_key:n.)

__tag_struct_get_dict_content:nN This maps the dictionary content of a structure into a tl-var. Basically it does what \pdfdict_use:n does. TODO!! this looks over-complicated. Check if it can be done with pdfdict now.

```

188 \cs_new_protected:Npn \__tag_struct_get_dict_content:nN #1 #2 %#1: structure num
189 {
190     \tl_clear:N #2
191     \seq_map_inline:cn
192     {
193         c__tag_struct_
194         \int_compare:nNnTF{#1}={0}{StructTreeRoot}{StructElem}
195         _entries_seq
196     }
197     {
198         \tl_put_right:Nx
199         #2
200         {
201             \prop_if_in:cnT
202             { g__tag_struct_#1_prop }
203             { ##1 }
204             {
205                 \c_space_tl/##1~\prop_item:cn{ g__tag_struct_#1_prop } { ##1 }
206             }
207         }
208     }
209 }

```

(End definition for __tag_struct_get_dict_content:nN.)

`__tag_struct_write_obj:n` This writes out the structure object. This is done in the finish code, in the tree module and guarded by the tree boolean.

```

210 \cs_new_protected:Npn \__tag_struct_write_obj:n #1 % #1 is the struct num
211 {
212   \pdf_object_if_exist:nTF { __tag/struct/#1 }
213   {
214     \__tag_struct_fill_kid_key:n { #1 }
215     \__tag_struct_get_dict_content:nN { #1 } \l__tag_tmpa_tl
216     \exp_args:Nx
217       \pdf_object_write:nx
218       { __tag/struct/#1 }
219       {
220         \l__tag_tmpa_tl
221       }
222   }
223   {
224     \msg_error:nnn { tag } { struct-no-objnum } { #1 }
225   }
226 }

```

(End definition for `__tag_struct_write_obj:n`.)

`__tag_struct_insert_annot:nn` This is the command to insert an annotation into the structure. It can probably be used for xform too.

Annotations used as structure content must

1. add a StructParent integer to their dictionary
2. push the object reference as OBJR object in the structure
3. Add a Structparent/obj-nr reference to the parent tree.

For a link this looks like this

```

(1) \tag_struct_begin:n { tag=Link }
    \tag_mc_begin:n { tag=Link }
    \pdfannot_dict_put:nnx
      { link/URI }
      { StructParent }
      { \int_use:N\c@g_@@_parenttree_obj_int }
    <start link> link text <stop link>
(2+3) \@@_struct_insert_annot:nn {obj ref}{parent num}
      \tag_mc_end:
      \tag_struct_end:

```

```

227 \cs_new_protected:Npn \__tag_struct_insert_annot:nn #1 #2 %#1 object reference to the annotat
228                                     %#2 structparent number
229 {
230   \bool_if:NT \g__tag_active_struct_bool
231   {
232     %get the number of the parent structure:
233     \seq_get:NNF
234       \g__tag_struct_stack_seq
235       \l__tag_struct_stack_parent_tmpa_tl
236     {

```

```

237         \msg_error:nn { tag } { struct-faulty-nesting }
238     }
239     %put the obj number of the annot in the kid entry, this also creates
240     %the OBJR object
241     \__tag_struct_kid_OBJR_gput_right:xx
242     {
243         \l__tag_struct_stack_parent_tmpa_tl
244     }
245     {
246         #1 %
247     }
248     % add the parent obj number to the parent tree:
249     \exp_args:Nnx
250     \__tag_parenttree_add_objr:nn
251     {
252         #2
253     }
254     {
255         \pdf_object_ref:e { __tag/struct/\l__tag_struct_stack_parent_tmpa_tl }
256     }
257     % increase the int:
258     \stepcounter{ g__tag_parenttree_obj_int }
259 }
260 }

```

(End definition for __tag_struct_insert_annot:nn.)

__tag_get_data_struct_tag: this command allows \tag_get:n to get the current structure tag with the keyword **struct_tag**. We will need to handle nesting

```

261 \cs_new:Npn \__tag_get_data_struct_tag:
262 {
263     \exp_args:Ne
264     \tl_tail:n
265     {
266         \prop_item:cn {g__tag_struct_\g__tag_struct_stack_current_tl _prop}{S}
267     }
268 }

```

(End definition for __tag_get_data_struct_tag:.)

5 Keys

This are the keys for the user commands. we store the tag in a variable. But we should be careful, it is only reliable at the begin.

```

label
stash 269 \keys_define:nn { __tag / struct }
tag    270 {
title  271     label .tl_set:N      = \l__tag_struct_key_label_tl,

7 Attributes and attribute classes

```

569 \<header>
570 \ProvidesExplPackage {tagpdf-attr-code} {2021-06-29} {0.9}
571 {part of tagpdf - code related to attributes and attribute classes}
572 \</header>

```

7.1 Variables

`\g__tag_attr_entries_prop` `\g_@@_attr_entries_prop` will store attribute names and their dictionary content.
`\g__tag_attr_class_used_seq` `\g_@@_attr_class_used_seq` will hold the attributes which have been used as class name. `\l_@@_attr_value_tl` is used to build the attribute array or key. Everytime an attribute is used for the first time, and object is created with its content, the name-object reference relation is stored in `\g_@@_attr_objref_prop`

```

573 \<*package>
574 \prop_new:N \g__tag_attr_entries_prop
575 \seq_new:N \g__tag_attr_class_used_seq
576 \tl_new:N \l_@@_attr_value_tl
577 \prop_new:N \g_@@_attr_objref_prop %will contain obj num of used attributes

(End definition for \g__tag_attr_entries_prop and others.)

```

7.2 Commands and keys

`__tag_attr_new_entry:nn` This allows to define attributes. Defined attributes are stored in a global property.
`newattribute` `newattribute` expects two brace group, the name and the content. The content typically needs an `/O` key for the owner. An example look like this.

```

\tagpdfsetup
{
  newattribute =
    {TH-col}{/O /Table /Scope /Column},
  newattribute =
    {TH-row}{/O /Table /Scope /Row},
}

578 \cs_new_protected:Npn \__tag_attr_new_entry:nn #1 #2 %#1:name, #2: content
579 {
580   \prop_gput:Nnn \g__tag_attr_entries_prop
581     {#1}{#2}
582 }
583
584 \keys_define:nn { __tag / setup }
585 {
586   newattribute .code:n =
587     {
588       \__tag_attr_new_entry:nn #1
589     }
590 }

```

(End definition for `__tag_attr_new_entry:nn` and `newattribute`. This function is documented on page 63.)

attribute-class attribute-class has to store the used attribute names so that they can be added to the ClassMap later.

```

591 \keys_define:nn { __tag / struct }
592 {
593   attribute-class .code:n =
594   {
595     \clist_set:No \l__tag_tmpa_clist { #1 }
596     \seq_set_from_clist:NN \l__tag_tmpa_seq \l__tag_tmpa_clist
597     \seq_map_inline:Nn \l__tag_tmpa_seq
598     {
599       \prop_if_in:NnF \g__tag_attr_entries_prop {##1}
600       {
601         \msg_error:nnn { tag } { attr-unknown } { ##1 }
602       }
603       \seq_gput_left:Nn\g__tag_attr_class_used_seq { ##1}
604     }
605     \seq_set_map:NNn \l__tag_tmpb_seq \l__tag_tmpa_seq
606     {
607       /##1
608     }
609     \tl_set:Nx \l__tag_tmpa_tl
610     {
611       \int_compare:nT { \seq_count:N \l__tag_tmpa_seq > 1 }{[]}
612       \seq_use:Nn \l__tag_tmpb_seq { \c_space_tl }

Part VIII

The tagpdf-luatex.def Driver for luatex Part of the tagpdf package

```
1 <@@=tag>
2 <*luatex>
3 \ProvidesExplFile {tagpdf-luatex.def} {2021-06-29} {0.9}
4 {tagpdf~driver~for~luatex}
```

1 Loading the lua

The space code requires that the fall back font has been loaded and initialized, so we force that first. But perhaps this could be done in the kernel.

```
5 {
6   \fontencoding{TU}\fontfamily{lmr}\fontseries{m}\fontshape{n}\fontsize{10pt}{10pt}\selectfont
7 }
8 \lua_now:e { tagpdf=require('tagpdf.lua') }
```

The following defines wrappers around prop and seq commands to store the data also in lua tables. I probably want also lua tables I put them in the ltx.@@.tables namespaces. The tables will be named like the variables but without backslash. To access such a table with a dynamical name create a string and then use ltx.@@.tables[string]. Old code, I'm not quite sure if this was a good idea. Now I have mix of table in ltx.@@.tables and ltx.@@.mc/struct. And a lot is probably not needed. TODO: this should be cleaned up, but at least roles are currently using the table!

62 \langle /luatex \rangle

The module declaration

```

63  $\langle$ *lua $\rangle$ 
64 -- tagpdf.lua
65 -- Ulrike Fischer
66
67 local ProvidesLuaModule = {
68   name      = "tagpdf",
69   version   = "0.9",      --TAGVERSION
70   date      = "2021-06-29", --TAGDATE
71   description = "tagpdf lua code",
72   license    = "The LATEX Project Public License 1.3c"
73 }
74
75 if luatexbase and luatexbase.provides_module then
76   luatexbase.provides_module (ProvidesLuaModule)
77 end
78
79 --[[

```

```

80 The code has quite probably a number of problems
81 - more variables should be local instead of global
82 - the naming is not always consistent due to the development of the code
83 - the traversing of the shipout box must be tested with more complicated setups
84 - it should probably handle more node types
85 -
86 --]]
87

```

Some comments about the lua structure.

```

88 --[[
89 the main table is named ltx.__tag. It contains the functions and also the data
90 collected during the compilation.
91
92 ltx.__tag.mc      will contain mc connected data.
93 ltx.__tag.struct  will contain structure related data.
94 ltx.__tag.page    will contain page data
95 ltx.__tag.tables  contains also data from mc and struct (from older code). This needs cleaning
96                 There are certainly dublettes, but I don't dare yet ...
97 ltx.__tag.func    will contain (public) functions.
98 ltx.__tag.trace   will contain tracing/logging functions.
99 local funktions  starts with __
100 functions meant for users will be in ltx.tag
101
102 functions
103 ltx.__tag.func.get_num_from (tag):   takes a tag (string) and returns the id number
104 ltx.__tag.func.output_num_from (tag): takes a tag (string) and prints (to tex) the id number
105 ltx.__tag.func.get_tag_from (num):   takes a num and returns the tag
106 ltx.__tag.func.output_tag_from (num): takes a num and prints (to tex) the tag
107 ltx.__tag.func.store_mc_data (num,key,data): stores key=data in ltx.__tag.mc[num]
108 ltx.__tag.func.store_mc_label (label,num): stores label=num in ltx.__tag.mc.labels
109 ltx.__tag.func.store_mc_kid (mcnum,kid,page): stores the mc-kids of mcnum on page page
110 ltx.__tag.func.store_mc_in_page(mcnum,mcpagecnt,page): stores in the page table the number of
111 ltx.__tag.func.store_struct_mcabs (structnum,mcnum): stores relations structnum<->mcnum (abs)
112 ltx.__tag.func.mc_insert_kids (mcnum): inserts the /K entries for mcnum by wandering through
113 ltx.__tag.func.mark_page_elements(box,mcpagecnt,mccntprev,mcopen,name,mctypeprev) : the main
114 ltx.__tag.func.mark_shipout (): a wrapper around the core function which inserts the last EM
115 ltx.__tag.func.fill_parent_tree_line (page): outputs the entries of the parenttree for this p
116 ltx.__tag.func.output_parenttree(): outputs the content of the parenttree
117 ltx.__tag.func.pdf_object_ref(name): outputs the object reference for the object name
118 ltx.__tag.func.markspaceon(), ltx.__tag.func.markspaceoff(): (de)activates the marking of pos
119 ltx.__tag.trace.show_mc_data (num,loglevel): shows ltx.__tag.mc[num] is the current log leve
120 ltx.__tag.trace.show_all_mc_data (max,loglevel): shows a maximum about mc's if the current l
121 ltx.__tag.trace.show_seq: shows a sequence (array)
122 ltx.__tag.trace.show_struct_data (num): shows data of structure num
123 ltx.__tag.trace.show_prop: shows a prop
124 ltx.__tag.trace.log
125 ltx.__tag.trace.showspace : boolean
126 --]]
127

```

This set-ups the main attribute registers. The mc_type attribute stores the type (P, Span etc) encoded as a num, The mc_cnt attribute stores the absolute number and allows so to see if a node belongs to the same mc-chunk.

The interwordspace attr is set by the function @@_mark_spaces, and marks the place where spaces should be inserted. The interwordfont attr is set by the function @@_mark_spaces too and stores the font, so that we can decide which font to use for the real space char.

```
128 local mctypeattributeid = luatexbase.new_attribute ("g__tag_mc_type_attr")
129 local mcntattributeid   = luatexbase.new_attribute ("g__tag_mc_cnt_attr")
130 local iwspaceattributeid = luatexbase.new_attribute ("g__tag_interwordspace_attr")
131 local iwfontattributeid  = luatexbase.new_attribute ("g__tag_interwordfont_attr")
```

with this token we can query the state of the boolean and so detect if unmarked nodes should be marked as attributes

```
132 local tagunmarkedbool= token.create("g__tag_tagunmarked_bool")
133 local truebool       = token.create("c_true_bool")
```

Now a number of local versions from global tables. Not all is perhaps needed, most node variants were copied from lua-debug.

```
134 local catlatex      = luatexbase.registernumber("catcodetable@latex")
135 local tableinsert    = table.insert
136 local nodeid         = node.id
137 local nodecopy       = node.copy
138 local nodegetattribute = node.get_attribute
139 local nodesetattribute = node.set_attribute
140 local nodehasattribute = node.has_attribute
141 local nodenew        = node.new
142 local nodetail       = node.tail
143 local nodeslide      = node.slide
144 local noderemove     = node.remove
145 local nodetraverseid = node.traverse_id
146 local nodetraverse   = node.traverse
147 local nodeinsertafter = node.insert_after
148 local nodeinsertbefore = node.insert_before
149 local pdfpageref     = pdf.pageref
150
151 local HLIST          = node.id("hlist")
152 local VLIST          = node.id("vlist")
153 local RULE           = node.id("rule")
154 local DISC           = node.id("disc")
155 local GLUE           = node.id("glue")
156 local GLYPH          = node.id("glyph")
157 local KERN           = node.id("kern")
158 local PENALTY        = node.id("penalty")
159 local LOCAL_PAR      = node.id("local_par")
160 local MATH           = node.id("math")
```

Now we setup the main table structure. ltx is used by other latex code too!

```
161 ltx          = ltx          or { }
162 ltx.__tag     = ltx.__tag     or { }
163 ltx.__tag.mc  = ltx.__tag.mc  or { } -- mc data
164 ltx.__tag.struct = ltx.__tag.struct or { } -- struct data
165 ltx.__tag.tables = ltx.__tag.tables or { } -- tables created with new prop and new seq.
166                                     -- wasn't a so great idea ...
167                                     -- g__tag_role_tags_seq used by tag<-> is in this tabl
168 ltx.__tag.page = ltx.__tag.page or { } -- page data, currently only i->{0->mcnum,1->mcr
169 ltx.__tag.trace = ltx.__tag.trace or { } -- show commands
170 ltx.__tag.func  = ltx.__tag.func  or { } -- functions
```

```
171 ltx.__tag.conf      = ltx.__tag.conf  or { } -- configuration variables
```

2 Logging functions

`__tag_log` This rather simple log function takes as argument a message (string) and a number and will output the message to the log/terminal if the current loglevel is greater or equal than num.

```
172 local __tag_log =
173   function (message,loglevel)
174     if (loglevel or 3) <= tex.count["l__tag_loglevel_int"] then
175       texio.write_nl("tagpdf: ".. message)
176     end
177   end
178
179 ltx.__tag.trace.log = __tag_log
```

(End definition for `__tag_log` and `ltx.__tag.trace.log`.)

`ltx.__tag.trace.show_seq` This shows the content of a seq as stored in the tables table. It is used by the `\@@_seq_show:N` function. It is not used in user commands, only for debugging, and so requires log level >0.

```
180 function ltx.__tag.trace.show_seq (seq)
181   if (type(seq) == "table") then
182     for i,v in ipairs(seq) do
183       __tag_log ("[" .. i .. "] => " .. tostring(v),1)
184     end
185   else
186     __tag_log ("sequence " .. tostring(seq) .. " not found",1)
187   end
188 end
```

(End definition for `ltx.__tag.trace.show_seq`.)

`__tag_pairs_prop` This shows the content of a prop as stored in the tables table. It is used by the `\@@_prop_show:N` function.

`ltx.__tag.trace.show_prop`

```
189 local __tag_pairs_prop =
190   function (prop)
191     local a = {}
192     for n in pairs(prop) do tableinsert(a, n) end
193     table.sort(a)
194     local i = 0                -- iterator variable
195     local iter = function ()   -- iterator function
196       i = i + 1
197       if a[i] == nil then return nil
198       else return a[i], prop[a[i]]
199     end
200   end
201   return iter
202 end
203
204
205 function ltx.__tag.trace.show_prop (prop)
206   if (type(prop) == "table") then
```

```

207   for i,v in __tag_pairs_prop (prop) do
208     __tag_log ("[" .. i .. "] => " .. tostring(v),1)
209   end
210 else
211   __tag_log ("prop " .. tostring(prop) .. " not found or not a table",1)
212 end
213 end

```

(End definition for __tag_pairs_prop and ltx.__tag.trace.show_prop.)

ltx.__tag.trace.show_mc_data This shows some data for a mc given by num. If something is shown depends on the log level. The function is used by the following function and then in \ShowTagging

```

214 function ltx.__tag.trace.show_mc_data (num,loglevel)
215   if ltx.__tag and ltx.__tag.mc and ltx.__tag.mc[num] then
216     for k,v in pairs(ltx.__tag.mc[num]) do
217       __tag_log ("mc"..num..": "..tostring(k)..=>"..tostring(v),loglevel)
218     end
219     if ltx.__tag.mc[num]["kids"] then
220       __tag_log ("mc" .. num .. " has " .. #ltx.__tag.mc[num]["kids"] .. " kids",loglevel)
221       for k,v in ipairs(ltx.__tag.mc[num]["kids"]) do
222         __tag_log ("mc " .. num .. " kid "..k.." => " .. v.kid.." on page " ..v.page,loglevel)
223       end
224     end
225   else
226     __tag_log ("mc"..num.." not found",loglevel)
227   end
228 end

```

(End definition for ltx.__tag.trace.show_mc_data.)

ltx.__tag.trace.show_all_mc_data This shows data for the mc's between min and max (numbers). It is used by the \ShowTagging function.

```

229 function ltx.__tag.trace.show_all_mc_data (min,max,loglevel)
230   for i = min, max do
231     ltx.__tag.trace.show_mc_data (i,loglevel)
232   end
233   texio.write_nl("")
234 end

```

(End definition for ltx.__tag.trace.show_all_mc_data.)

ltx.__tag.trace.show_struct_data This function shows some struct data. Unused but kept for debugging.

```

235 function ltx.__tag.trace.show_struct_data (num)
236   if ltx.__tag and ltx.__tag.struct and ltx.__tag.struct[num] then
237     for k,v in ipairs(ltx.__tag.struct[num]) do
238       __tag_log ("struct "..num..": "..tostring(k)..=>"..tostring(v),1)
239     end
240   else
241     __tag_log ("struct "..num.." not found ",1)
242   end
243 end

```

(End definition for ltx.__tag.trace.show_struct_data.)

3 Helper functions

3.1 Retrieve data functions

`__tag_get_mc_cnt_type_tag` This takes a node as argument and returns the mc-cnt, the mc-type and and the tag (calculated from the mc-cnt.

```

244 local __tag_get_mc_cnt_type_tag = function (n)
245   local mcnt      = nodegetattribute(n,mcntattributeid) or -1
246   local mctype    = nodegetattribute(n,mctypeattributeid) or -1
247   local tag       = ltx.__tag.func.get_tag_from(mctype)
248   return mcnt,mctype,tag
249 end

```

(End definition for `__tag_get_mc_cnt_type_tag`.)

`__tag_get_mathsubtype` This function allows to detect if we are at the begin or the end of math. It takes as argument a mathnode.

```

250 local function __tag_get_mathsubtype (mathnode)
251   if mathnode.subtype == 0 then
252     subtype = "beginmath"
253   else
254     subtype = "endmath"
255   end
256   return subtype
257 end

```

(End definition for `__tag_get_mathsubtype`.)

`__tag_get_num_from` These functions take as argument a string `tag`, and return the number under which is it recorded (and so the attribute value). The first function outputs the number for lua, `ltx.__tag.func.get_num_from` while the output function outputs to tex, `ltx.__tag.func.output_num_from`

```

258 local __tag_get_num_from =
259   function (tag)
260     if ltx.__tag.tables["g__tag_role_tags_prop"][tag] then
261       a= ltx.__tag.tables["g__tag_role_tags_prop"][tag]
262     else
263       a= -1
264     end
265     return a
266   end
267
268 ltx.__tag.func.get_num_from = __tag_get_num_from
269
270 function ltx.__tag.func.output_num_from (tag)
271   local num = __tag_get_num_from (tag)
272   tex.sprint(catlatex,num)
273   if num == -1 then
274     __tag_log ("Unknown tag "..tag.." used")
275   end
276 end

```

(End definition for `__tag_get_num_from`, `ltx.__tag.func.get_num_from`, and `ltx.__tag.func.output_num_from`.)

<pre> __tag_get_tag_from ltx.__tag.func.get_tag_from ltx.__tag.func.output_tag_from </pre>	<p>These functions are the opposites to the previous function: they take as argument a number (the attribute value) and return the string <code>tag</code>. The first function outputs the number for lua, while the <code>output</code> function outputs to tex.</p> <pre> 277 local __tag_get_tag_from = 278 function (num) 279 if ltx.__tag.tables["g__tag_role_tags_seq"][num] then 280 a = ltx.__tag.tables["g__tag_role_tags_seq"][num] 281 else 282 a = "UNKNOWN" 283 end 284 return a 285 end 286 287 ltx.__tag.func.get_tag_from = __tag_get_tag_from 288 289 function ltx.__tag.func.output_tag_from (num) 290 tex.sprint(catlatex,__tag_get_tag_from (num)) 291 end </pre> <p>(End definition for <code>__tag_get_tag_from</code>, <code>ltx.__tag.func.get_tag_from</code>, and <code>ltx.__tag.func.output_tag_from</code>.)</p>
<pre> ltx.__tag.func.store_mc_data </pre>	<p>This function stores for <code>key=data</code> for mc-chunk <code>num</code>. It is used in the <code>tagpdf-mc</code> code, to store for example the tag string, and the raw options.</p> <pre> 292 function ltx.__tag.func.store_mc_data (num,key,data) 293 ltx.__tag.mc[num] = ltx.__tag.mc[num] or { } 294 ltx.__tag.mc[num][key] = data 295 __tag_log ("INFO TEX-STORE-MC-DATA: "..num.." => "..tostring(key).. " => "..tostring(data),3) 296 end </pre> <p>(End definition for <code>ltx.__tag.func.store_mc_data</code>.)</p>
<pre> ltx.__tag.func.store_mc_label </pre>	<p>This function stores the <code>label=num</code> relationship in the <code>labels</code> subtable. TODO: this is probably unused and can go.</p> <pre> 297 function ltx.__tag.func.store_mc_label (label,num) 298 ltx.__tag.mc["labels"] = ltx.__tag.mc["labels"] or { } 299 ltx.__tag.mc.labels[label] = num 300 end </pre> <p>(End definition for <code>ltx.__tag.func.store_mc_label</code>.)</p>
<pre> ltx.__tag.func.store_mc_kid </pre>	<p>This function is used in the traversing code. It stores a sub-chunk of a mc <code>mcnum</code> into the <code>kids</code> table.</p> <pre> 301 function ltx.__tag.func.store_mc_kid (mcnum,kid,page) 302 ltx.__tag.trace.log("INFO TAG-STORE-MC-KID: "..mcnum.." => " .. kid.." on page " .. page,3) 303 ltx.__tag.mc[mcnum]["kids"] = ltx.__tag.mc[mcnum]["kids"] or { } 304 local kidtable = {kid=kid,page=page} 305 tableinsert(ltx.__tag.mc[mcnum]["kids"], kidtable) 306 end </pre> <p>(End definition for <code>ltx.__tag.func.store_mc_kid</code>.)</p>

ltx.__tag.func.mc_num_of_kids This function returns the number of kids a mc mcnun has. We need to account for the case that a mc can have no kids.

```

307 function ltx.__tag.func.mc_num_of_kids (mcnum)
308   local num = 0
309   if ltx.__tag.mc[mcnun] and ltx.__tag.mc[mcnun]["kids"] then
310     num = #ltx.__tag.mc[mcnun]["kids"]
311   end
312   ltx.__tag.trace.log ("INFO MC-KID-NUMBERS: " .. mcnun .. "has " .. num .. "KIDS",4)
313   return num
314 end

```

(End definition for ltx.__tag.func.mc_num_of_kids.)

3.2 Functions to insert the pdf literals

__tag_insert_emc_node This insert the emc node.

```

315 local function __tag_insert_emc_node (head,current)
316   local emcnode = nodenew("whatsit","pdf_literal")
317     emcnode.data = "EMC"
318     emcnode.mode=1
319     head = node.insert_before(head,current,emcnode)
320   return head
321 end

```

(End definition for __tag_insert_emc_node.)

__tag_insert_bmc_node This inserts a simple bmc node

```

322 local function __tag_insert_bmc_node (head,current,tag)
323   local bmcnode = nodenew("whatsit","pdf_literal")
324     bmcnode.data = "/"..tag.." BMC"
325     bmcnode.mode=1
326     head = node.insert_before(head,current,bmcnode)
327   return head
328 end

```

(End definition for __tag_insert_bmc_node.)

__tag_insert_bdc_node This inserts a bcd node with a fix dict. TODO: check if this is still used, now that we create properties.

```

329 local function __tag_insert_bdc_node (head,current,tag,dict)
330   local bdcnode = nodenew("whatsit","pdf_literal")
331     bdcnode.data = "/"..tag.."<<..dict..>> BDC"
332     bdcnode.mode=1
333     head = node.insert_before(head,current,bdcnode)
334   return head
335 end

```

(End definition for __tag_insert_bdc_node.)

__tag_pdf_object_ref This allows to reference a pdf object reserved with the l3pdf command by name. The return value is n 0 R, if the object doesn't exist, n is 0. TODO: is uses internal l3pdf commands, this should be properly supported by l3pdf

```

336 local function __tag_pdf_object_ref (name)
337   local tokename = 'c_pdf_backend_object_'..name..'_int'

```

```

338     local object = token.create(tokenname).index..' 0 R'
339     return object
340 end
341 ltx.__tag.func.pdf_object_ref=__tag_pdf_object_ref

(End definition for __tag_pdf_object_ref and ltx.__tag.func.pdf_object_ref.)

```

4 Function for the real space chars

`__tag_show_spacemark` A debugging function, it is used to inserts red color markers in the places where space chars can go, it can have side effects so not always reliable, but ok.

```

342 local function __tag_show_spacemark (head,current,color,height)
343     local markcolor = color or "1 0 0"
344     local markheight = height or 10
345     local pdfstring = node.new("whatsit","pdf_literal")
346         pdfstring.data =
347             string.format("q "..markcolor.." RG "..markcolor.." rg 0.4 w 0 %g m 0 %g l S Q",-
348                 3,markheight)
349             head = node.insert_after(head,current,pdfstring)
350     return head
351 end

(End definition for __tag_show_spacemark.)

```

`__tag_fakespace` This is used to define a lua version of `\pdf-fakespace`

```

ltx.__tag.func.fakespace 351 local function __tag_fakespace()
352     tex.setattribute(iwspaceattributeid,1)
353     tex.setattribute(iwfontattributeid,font.current())
354 end
355 ltx.__tag.func.fakespace = __tag_fakespace

(End definition for __tag_fakespace and ltx.__tag.func.fakespace.)

```

`__tag_mark_spaces` a function to mark up places where real space chars should be inserted. It only sets attributes, these are then be used in a later traversing which inserts the actual spaces. When space handling is activated this function is inserted in some callbacks.

```

356 --[[ a function to mark up places where real space chars should be inserted

5 Function for the tagging

ltx.__tag.func.mc_insert_kids This is the main function to insert the K entry into a StructElem object. It is used in tagpdf-mc-luacode module. The `single` attribute allows to handle the case that a single mc on the tex side can have more than one kid after the processing here, and so we get the correct array/non array setup.

```

469 function ltx.__tag.func.mc_insert_kids (mcnum,single)
470   if ltx.__tag.mc[mcnum] then
471     ltx.__tag.trace.log("INFO TEX-MC-INSERT-KID-TEST: " .. mcnum,4)
472     if ltx.__tag.mc[mcnum]["kids"] then
473       if #ltx.__tag.mc[mcnum]["kids"] > 1 and single==1 then
474         tex.sprint("[")
475       end
476       for i,kidstable in ipairs( ltx.__tag.mc[mcnum]["kids"] ) do
477         local kidnum = kidstable["kid"]
478         local kidpage = kidstable["page"]
479         local kidpageobjnum = pdfpageref(kidpage)
480         ltx.__tag.trace.log("INFO TEX-MC-INSERT-KID: " .. mcnum ..
481           " insert KID " .. i ..
482           " with num " .. kidnum ..
483           " on page " .. kidpage .. "/" .. kidpageobjnum,3)
484         tex.sprint(catlatex,"<</Type /MCR /Pg " .. kidpageobjnum .. " 0 R /MCID " .. kidnum .. ">> ")
485       end
486       if #ltx.__tag.mc[mcnum]["kids"] > 1 and single==1 then
487         tex.sprint("]")
488       end
489     else
490       -- this is typically not a problem, e.g. empty hbox in footer/header can
491       -- trigger this warning.
492       ltx.__tag.trace.log("WARN TEX-MC-INSERT-NO-KIDS: " .. mcnum .. " has no kids",2)
493       if single==1 then
494         tex.sprint("null")
495       end
496     end
497   else
498     ltx.__tag.trace.log("WARN TEX-MC-INSERT-MISSING: " .. mcnum .. " doesn't exist",0)
499   end
500 end

```

(End definition for ltx.__tag.func.mc_insert_kids.)

ltx.__tag.func.store_struct_mcabs This function is used in the tagpdf-mc-luacode. It store the absolute count of the mc into the current structure. This must be done ordered.

```

501 function ltx.__tag.func.store_struct_mcabs (structnum,mcnum)
502   ltx.__tag.struct[structnum]=ltx.__tag.struct[structnum] or { }
503   ltx.__tag.struct[structnum]["mc"]=ltx.__tag.struct[structnum]["mc"] or { }

```

```

504 -- a structure can contain more than on mc chunk, the content should be ordered
505 tableinsert(ltx.__tag.struct[structnum]["mc"],mcnum)
506 ltx.__tag.trace.log("INFO TEX-MC-INTO-STRUCT: "..
507     mcnum.." inserted in struct "..structnum,3)
508 -- but every mc can only be in one structure
509 ltx.__tag.mc[mcnum]= ltx.__tag.mc[mcnum] or { }
510 ltx.__tag.mc[mcnum]["parent"] = structnum
511 end
512

```

(End definition for ltx.__tag.func.store_struct_mcabs.)

ltx.__tag.func.store_mc_in_page This is used in the traversing code and stores the relation between abs count and page count.

```

513 -- pay attention: lua counts arrays from 1, tex pages from one
514 -- mcid and arrays in pdf count from 0.
515 function ltx.__tag.func.store_mc_in_page (mcnum,mcpagecnt,page)
516     ltx.__tag.page[page] = ltx.__tag.page[page] or {}
517     ltx.__tag.page[page][mcpagecnt] = mcnum
518     ltx.__tag.trace.log("INFO TAG-MC-INTO-PAGE: page " .. page ..
519         ": inserting MCID " .. mcpagecnt .. " => " .. mcnum,3)
520 end

```

(End definition for ltx.__tag.func.store_mc_in_page.)

ltx.__tag.func.mark_page_elements This is the main traversing function. See the lua comment for more details.

```

521 --[[
522     Now follows the core function
523     It wades through the shipout box and checks the attributes
524     ARGUMENTS
525     box: is a box,
526     mcpagecnt: num, the current page cnt of mc (should start at -1 in shipout box), needed for
527     mcntprev: num, the attribute cnt of the previous node/whatever - if different we have a c
528     mcopy: num, records if some bdc/emc is open
529     These arguments are only needed for log messages, if not present are replaces by fix string
530     name: string to describe the box
531     mctypeprev: num, the type attribute of the previous node/whatever
532
533     there are lots of logging messages currently. Should be cleaned up in due course.
534     One should also find ways to make the function shorter.

```

Part IX

The tagpdf-roles module

Tags, roles and namespace code

Part of the tagpdf package

```
1 <@@=tag>
2 <*header>
3 \ProvidesExplPackage {tagpdf-roles-code} {2021-06-29} {0.9}
4 {part of tagpdf - code related to roles and structure names}
5 </header>
```

1 Code related to roles and structure names

1.1 Variables

Tags have both a name (a string) and a number (for the lua attribute). Testing a name is easier with a prop, while accessing with a number is better done with a seq. So both are used and must be kept in sync if a new tag is added. The number is only relevant for the MC type, tags with the same name from different names spaces can have the same number.

```
\g__tag_role_tags_seq
\g__tag_role_tags_prop 6 <*package>
7 \__tag_seq_new:N \g__tag_role_tags_seq %to get names (type/NS) from numbers
8 \__tag_prop_new:N \g__tag_role_tags_prop %to get numbers from names (type/NS)
(End definition for \g__tag_role_tags_seq and \g__tag_role_tags_prop.)
```

```
\g__tag_role_tags_NS_prop in pdf 2.0 tags belong to a name space. For every tag we store a default name space.
The keys are the tags, the value shorthands like pdf2, or mathml. There is no need to
access this from lua, so we use the standard prop commands.
```

```
9 \prop_new:N \g__tag_role_tags_NS_prop %to namespace info
(End definition for \g__tag_role_tags_NS_prop.)
```

```
\g__tag_role_NS_prop The standard names spaces are the following. The keys are the name tagpdf will use, the
urls are the identifier in the namespace object.
```

mathml <http://www.w3.org/1998/Math/MathML>

pdf2 <http://iso.org/pdf/ssn>

pdf <http://iso.org/pdf/ssn> (default)

user \c__tag_role_userNS_id_str (random id, for user tags)

More namespaces are possible and their objects references and the ones of the namespaces must be collected so that an array can be written to the StructTreeRoot at the end (see tagpdf-tree). We use a prop to store also the object reference as it will be needed rather often.

```
10 \prop_new:N \g__tag_role_NS_prop % collect namespaces
```

(End definition for \g__tag_role_NS_prop.)

We need also a bunch of temporary variables:

```
\l__tag_role_tag_tmpa_tl
\l__tag_role_tag_namespace_tmpa_tl 11 \tl_new:N \l__tag_role_tag_tmpa_tl
\l__tag_role_role_tmpa_tl          12 \tl_new:N \l__tag_role_tag_namespace_tmpa_tl
\l__tag_role_role_namespace_tmpa_tl 13 \tl_new:N \l__tag_role_role_tmpa_tl
                                   14 \tl_new:N \l__tag_role_role_namespace_tmpa_tl
```

(End definition for \l__tag_role_tag_tmpa_tl and others.)

1.2 Namespaces

The following commands setups a names space. Namespace dictionaries can contain an optional /Schema and /RoleMapNS entry. We only reserve the objects but delay the writing to the finish code, where we can test if the keys and the name spaces are actually needed This commands setups objects for the name space and its rolemap. It also initialize a prop to collect the rolemaps if needed.

```
\__tag_role_NS_new:nnn \__tag_role_NS_new:nnn{<shorthand>}{<URI-ID>}Schema
```

```
\__tag_role_NS_new:nnn
15 \cs_new_protected:Npn \__tag_role_NS_new:nnn #1 #2 #3
16 {
17   \pdf_object_new:nn {tag/NS/#1}{dict}
18   \pdfdict_new:n     {g__tag_role/Namespace_#1_dict}
19   \pdf_object_new:nn {\__tag/RoleMapNS/#1}{dict}
20   \pdfdict_new:n     {g__tag_role/RoleMapNS_#1_dict}
21   \pdfdict_gput:nnn
22     {g__tag_role/Namespace_#1_dict}
23     {Type}
24     {/Namespace}
25   \pdf_string_from_unicode:nnN{utf8/string}{#2}\l_tmpa_str
26   \tl_if_empty:NF \l_tmpa_str
27   {
28     \pdfdict_gput:nnx
29       {g__tag_role/Namespace_#1_dict}
30       {NS}
31       {\l_tmpa_str}
32   }
33   %RoleMapNS is added in tree
34   \tl_if_empty:NF {#3}
35   {
36     \pdfdict_gput:nnx{g__tag_role/Namespace_#1_dict}
37       {Schema}{#3}
38   }
39   \prop_gput:Nnx \g__tag_role_NS_prop {#1}{\pdf_object_ref:n{tag/NS/#1}~}
40 }
```

(End definition for __tag_role_NS_new:nnn.)

We need an id for the user space. For the tests it should be possible to set it to a fix value. So we use random numbers which can be fixed by setting a seed. We fake a sort of GUID but not try to be really exact as it doesn't matter ...

```
\c__tag_role_userNS_id_str
```

```

41 \str_const:Nx \c__tag_role_userNS_id_str
42 { data:,
43   \int_to_Hex:n{\int_rand:n {65535}}
44   \int_to_Hex:n{\int_rand:n {65535}}
45   -
46   \int_to_Hex:n{\int_rand:n {65535}}
47   -
48   \int_to_Hex:n{\int_rand:n {65535}}
49   -
50   \int_to_Hex:n{\int_rand:n {65535}}
51   -
52   \int_to_Hex:n{\int_rand:n {16777215}}
53   \int_to_Hex:n{\int_rand:n {16777215}}
54 }

```

(End definition for \c__tag_role_userNS_id_str.)

Now we setup the standard names spaces. Currently only if we detect pdf2.0 but this will perhaps have to change if the structure code gets to messy.

```

55 \pdf_version_compare:NnT > {1.9}
56 {
57   \__tag_role_NS_new:nnn {pdf}   {http://iso.org/pdf/ssn}{ }
58   \__tag_role_NS_new:nnn {pdf2}  {http://iso.org/pdf2/ssn}{ }
59   \__tag_role_NS_new:nnn {mathml}{http://www.w3.org/1998/Math/MathML}{ }
60   \exp_args:Nnx
61   \__tag_role_NS_new:nnn {user}{\c__tag_role_userNS_id_str}{ }
62 }

```

1.3 Data

In this section we setup the standard data. At first the list of structure types. We split them in three lists, the tags with which are both in the pdf and pdf2 namespace, the one only in pdf and the one with the tags only in pdf2. We also define a rolemap for the pdfII only type to pdf so that they can always be used.

```

388     }
389     { #1 }
390 }

```

1.4 Adding new tags and rolemapping

1.4.1 pdf 1.7 and earlier

With this versions only RoleMap is filled. At first the dictionary:

g__tag_role/RoleMap_dict

```
391 \pdfdict_new:n {g__tag_role/RoleMap_dict}
```

(End definition for g__tag_role/RoleMap_dict.)

__tag_role_add_tag:nn The pdf 1.7 version has only two arguments: new and rolemap name. To make pdf 2.0 types usable we directly define a rolemapping for them.

```
392 \cs_new_protected:Nn \__tag_role_add_tag:nn {(new) name, reference to old
```

```
393 {
```

```
394   \prop_if_in:NnF \g__tag_role_tags_prop {#1}
```

```
395   {
```

```
396     \int_compare:nNnT {\l__tag_loglevel_int} > { 0 }
```

```
397     {
```

```
398       \msg_info:nnn { tag }{new-tag}{#1}
```

```
399     }
```

```
400     \__tag_seq_gput_right:Nn \g__tag_role_tags_seq { #1 }
```

```
401     \__tag_prop_gput:Nnx \g__tag_role_tags_prop { #1 }
```

```
402     {
```

```
403       \seq_count:N \g__tag_role_tags_seq
```

```
404     }
```

```
405     \prop_gput:Nnn \g__tag_role_tags_NS_prop { #1 }{ user }
```

```
406   }
```

```
407   \__tag_check_add_tag_role:nn {#1}{#2}
```

```
408   \tl_if_empty:nF { #2 }
```

```
409   {
```

```
410     \pdfdict_gput:nnx {g__tag_role/RoleMap_dict}
```

```
411     {#1}
```

```
412     {\pdf_name_from_unicode_e:n{#2}}
```

```
413   }
```

```
414 }
```

```
415 \cs_generate_variant:Nn \__tag_role_add_tag:nn {VV}
```

```
416
```

```
417 \pdf_version_compare:NnT < {2.0}
```

```
418 {
```

```
419   \prop_map_inline:Nn \c__tag_role_sttags_pdfII_to_pdf_prop
```

```
420   {
```

```
421     \__tag_role_add_tag:nn {#1}{#2}
```

```
422   }
```

```
423 }
```

```
424
```

(End definition for __tag_role_add_tag:nn.)

1.4.2 The pdf 2.0 version

__tag_role_add_tag:nnnn The pdf 2.0 version takes four arguments: tag/namespace/role/namespace

```
425 \cs_new_protected:Nn \__tag_role_add_tag:nnnn {tag/namespace/role/namespace
```

```
426 {
```

```
427   \int_compare:nNnT {\l__tag_loglevel_int} > { 0 }
```

```
428   {
```

```
429     \msg_info:nnn { tag }{new-tag}{#1}
```

```
430   }
```

```
431   \__tag_seq_gput_right:Nn \g__tag_role_tags_seq { #1 }
```

```
432   \__tag_prop_gput:Nnx \g__tag_role_tags_prop { #1 }
```

```

433     {
434         \seq_count:N \g__tag_role_tags_seq
435     }
436     \prop_gput:Nnn \g__tag_role_tags_NS_prop { #1 }{ #2 }
437     \__tag_check_add_tag_role:nn {#1}{#3}
438     \pdfdict_gput:nxx {g__tag_role/RoleMapNS_#2_dict}{#1}
439     {
440         [
441             \pdf_name_from_unicode_e:n{#3}
442             \c_space_tl
443             \pdf_object_ref:n {tag/NS/#4}
444         ]
445     }
446 }
447 \cs_generate_variant:Nn \__tag_role_add_tag:nnnn {VVVV}

```

(End definition for __tag_role_add_tag:nnnn.)

1.5 Key-val user interface

The user interface use the key `add-new-tag`, which takes either a keyval list as argument, or a tag/role.

```

tag
tag-namespace
role
role-namespace
add-new-tag
448 \keys_define:nn { __tag / tag-role }
449 {
450     ,tag .tl_set:N = \l__tag_role_tag_tmpa_tl
451     ,tag-namespace .tl_set:N = \l__tag_role_tag_namespace_tmpa_tl
452     ,role .tl_set:N = \l__tag_role_role_tmpa_tl
453     ,role-namespace .tl_set:N = \l__tag_role_role_namespace_tmpa_tl
454 }
455
456 \keys_define:nn { __tag / setup }
457 {
458     add-new-tag .code:n =
459     {
460         \keys_set_known:nnnN

501         \l__tag_role_role_namespace_tmpa_tl
502 }
503 }
504 }
505 \end{package}

```

(End definition for tag and others. These functions are documented on page 61.)

Part X

The tagpdf-space module

Code related to real space chars

Part of the tagpdf package

```
1 <@@=tag>
2 <*header>
3 \ProvidesExplPackage {tagpdf-space-code} {2021-06-29} {0.9}
4 {part of tagpdf - code related to real space chars}
5 </header>
```

1 Code for interword spaces

The code is engine/backend dependant. Basically only pdfTeX and LuaTeX support real space chars. Most of the code for LuaTeX which uses attributes is in the Lua code, here are only the keys.

```
interwordspace
show-spaces
6 <*package>
7 \sys_if_engine_pdfTeX:T
8 {
9   \sys_if_output_pdf:TF
10  {
11    \pdfglyphtounicode{space}{0020}
