

This is a test document demonstrating abbreviation styles provided by the `glossaries-extra` package. Hyperlinks are shown in [magenta](#).

Some of the styles just use the default formatting commands (which don't change the font). To make the default setting clearer, this document has done:

```
\renewcommand{\glslongdefaultfont}[1]{\textsf{#1}}
\renewcommand{\glsabbrvdefaultfont}[1]{\textsf{#1}}
```

So any text in this document that's rendered in sans-serif would normally not have any font change implemented.

Each test entry is defined using

```
\newabbreviation[category=#1,user1={user text}]%
{sample-#1}{short}{long form}%
```

for the non-desc styles or

```
\newabbreviation[category=#1,user1={user text},%
description={sample description}]%
{sample-#1}{short}{long form}%
```

for the -desc styles (where #1 is the style label). Note that many of the entries will have duplicate sort values, so don't build this with `xindy`. You can change the ordering in the glossary to that it's sorted according to the style name by changing the above definitions to:

```
\newabbreviation[category=#1,user1={user text},sort={#1}]%
{sample-#1}{short}{long form}%
\newabbreviation[category=#1,user1={user text},sort={#1},%
description={sample description}]%
{sample-#1}{short}{long form}%
```

To assist with distinguishing between the various styles, the post-description hook (used after displaying the description in the glossary) is set to `\[style:\[#1]` for all categories, and the footnote command `\glsxtrabbrvfootnote` has been redefined to include the short form hyperlinked to the glossary.

The test entries that use the -hyphen styles have had the `markwords` attribute set. This is designed to trigger compound word hyphenation if the inserted text (through the final optional argument of `\gls`) starts with a hyphen.

## Chapter 3

# First Use With Insert

First use of `\gls{label}[-insert]`. The conditional `\ifglstrinsertinside` is used by some styles to determine whether or not to include the inserted material inside the font changing command used by the style. The default is: false.

In this test chapter, each entry is reset, then displayed with

```
\glstrinsertinsidefalse
```

then reset and displayed with

```
\glstrinsertinsidetrue
```

(following the semi-colon). Some styles may only obey this conditional for particular commands. (For example, the inline commands like `\glstrfull` may behave differently to commands like `\gls`.)

Some of the styles just use the default font commands (which don't change the font) so there's no noticeable difference. To make the differences more noticeable this document has done:

```
\renewcommand{\glslongdefaultfont}[1]{\textsf{#1}}
\renewcommand{\glsabbrvdefaultfont}[1]{\textsf{#1}}
```

# Next Use With Insert

Next use of `\gls{label}[-insert]`.

In this test chapter, each entry is displayed with `\glstrinsertinsidefalse` and then displayed with `\glstrinsertinsidetrue` (following the semi-colon). Some styles don't check this conditional.

## Chapter 13

# First Form With Insert

First form using `\glsfirst{label}[-insert]`. This is different from the first use of `\gls` as can be seen by the location of the inserted material. (There's no check for the conditional `\ifglstrinsertinside`.) In general it's best not to use `\glsfirst` with abbreviations. Use either `\gls` (possibly with a reset) or `\glstrfull`.
