*Significant portions of the code here are adapted/simplified from the packages `luatex` and `luatexbase` written by Heiko Oberdiek, Élie Roux, Manuel Pégourié-Gonnar and Philipp Gesang.

1 Overview

LuaTeX adds a number of engine-specific functions to TeX. Several of these require set up that is best done in the kernel or need related support functions. This file provides *basic* support for LuaTeX at the L^AT_ΕX 2_ε kernel level plus as a loadable file which can be used with plain TeX and L^AT_ΕX.

This file contains code for both TeX (to be stored as part of the format) and Lua (to be loaded at the start of each job). In the Lua code, the kernel uses the namespace `luatexbase`.

The following `\count` registers are used here for register allocation:

```
\e@alloc@attribute@count Attributes (default 258)
\e@alloc@ccodetable@count Category code tables (default 259)
\e@alloc@luafunction@count Lua functions (default 260)
  \e@alloc@whatsit@count User whatsits (default 261)
  \e@alloc@bytecode@count Lua bytecodes (default 262)
  \e@alloc@luachunk@count Lua chunks (default 263)
```

(`\count 256` is used for `\newmarks` allocation and `\count 257` is used for `\newXeTeXintercharclass` with XeTeX, with code defined in `ltfinal.dtx`). With any L^AT_ΕX 2_ε kernel from 2015 onward these registers are part of the block in the extended area reserved by the kernel (prior to 2015 the L^AT_ΕX 2_ε kernel did not provide any functionality for the extended allocation area).

2 Core TeX functionality

The commands defined here are defined for possible inclusion in a future L^AT_ΕX format, however also extracted to the file `ltluatex.tex` which may be used with older L^AT_ΕX formats, and with plain TeX.

<code>\newattribute</code>	<code>\newattribute{<attribute>}</code>	Defines a named <code>\attribute</code> , indexed from 1 (<i>i.e.</i> <code>\attribute0</code> is never defined). Attributes initially have the marker value <code>-7FFFFFFF</code> ('unset') set by the engine.
<code>\newcatcodetable</code>	<code>\newcatcodetable{<catcodetable>}</code>	Defines a named <code>\catcodetable</code> , indexed from 1 (<code>\catcodetable0</code> is never assigned). A new catcode table will be populated with exactly those values assigned by IniTeX (as described in the LuaTeX manual).
<code>\newluafunction</code>	<code>\newluafunction{<function>}</code>	Defines a named <code>\luafunction</code> , indexed from 1. (Lua indexes tables from 1 so <code>\luafunction0</code> is not available).
<code>\newluacmd</code>	<code>\newluadef{<function>}</code>	Like <code>\newluafunction</code> , but defines the command using <code>\luadef</code> instead of just assigning an integer.
<code>\newprotectedluacmd</code>	<code>\newluadef{<function>}</code>	Like <code>\newluacmd</code> , but the defined command is not expandable.
<code>\newwhatsit</code>	<code>\newwhatsit{<whatsit>}</code>	Defines a custom <code>\whatsit</code> , indexed from 1.
<code>\newluabytecode</code>	<code>\newluabytecode{<bytecode>}</code>	

	Allocates a number for Lua bytecode register, indexed from 1.
<code>\newluachunkname</code>	<code>newluachunkname{⟨chunkname⟩}</code> Allocates a number for Lua chunk register, indexed from 1. Also enters the name of the register (without backslash) into the <code>lua.name</code> table to be used in stack traces.
<code>\catcodetable@initex</code>	Predefined category code tables with the obvious assignments. Note that the
<code>\catcodetable@string</code>	<code>latex</code> and <code>atletter</code> tables set the full Unicode range to the codes predefined by
<code>\catcodetable@latex</code>	the kernel.
<code>\catcodetable@atletter</code>	<code>\setattribute{⟨attribute⟩}{⟨value⟩}</code>
<code>\setattribute</code>	<code>\unsetattribute{⟨attribute⟩}</code>
<code>\unsetattribute</code>	Set and unset attributes in a manner analogous to <code>\setlength</code> . Note that attributes take a marker value when unset so this operation is distinct from setting the value to zero.

3 Plain T_EX interface

The `luatex` interface may be used with plain T_EX using `\input{ltuatex}`. This inputs `ltuatex.tex` which inputs `etex.src` (or `etex.sty` if used with L^AT_EX) if it is not already input, and then defines some internal commands to allow the `luatex` interface to be defined.

The `luatexbase` package interface may also be used in plain T_EX, as before, by inputting the package `\input luatexbase.sty`. The new version of `luatexbase` is based on this `luatex` code but implements a compatibility layer providing the interface of the original package.

4 Lua functionality

4.1 Allocators in Lua

<code>new_attribute</code>	<code>luatexbase.new_attribute(⟨attribute⟩)</code> Returns an allocation number for the <code>⟨attribute⟩</code> , indexed from 1. The attribute will be initialised with the marker value <code>-0xFFFFFFFF</code> ('unset'). The attribute allocation sequence is shared with the T _E X code but this function does <i>not</i> define a token using <code>\attributedef</code> . The attribute name is recorded in the <code>attributes</code> table. A metatable is provided so that the table syntax can be used consistently for attributes declared in T _E X or Lua.
<code>new_whatsit</code>	<code>luatexbase.new_whatsit(⟨whatsit⟩)</code> Returns an allocation number for the custom <code>⟨whatsit⟩</code> , indexed from 1.
<code>new_bytecode</code>	<code>luatexbase.new_bytecode(⟨bytecode⟩)</code> Returns an allocation number for a bytecode register, indexed from 1. The optional <code>⟨name⟩</code> argument is just used for logging.
<code>new_chunkname</code>	<code>luatexbase.new_chunkname(⟨chunkname⟩)</code> Returns an allocation number for a Lua chunk name for use with <code>\directlua</code> and <code>\l_uatlua</code> , indexed from 1. The number is returned and also <code>⟨name⟩</code> argument is added to the <code>lua.name</code> array at that index.
<code>new_luafunction</code>	<code>luatexbase.new_luafunction(⟨functionname⟩)</code> Returns an allocation number for a lua function for use with <code>\luafunction</code> , <code>\l_uatluafunction</code> , and <code>\lua_udef</code> , indexed from 1. The optional <code>⟨functionname⟩</code> argument is just used for logging.

These functions all require access to a named T_EX count register to manage their allocations. The standard names are those defined above for access from T_EX, *e.g.* “e@alloc@attribute@count, but these can be adjusted by defining the variable `<type>_count_name` before loading `ltluatex.lua`, for example

```
local attribute_count_name = "attributetracker"
require("ltluatex")
```

would use a T_EX `\count` (`\countdef`’d token) called `attributetracker` in place of “e@alloc@attribute@count.

4.2 Lua access to T_EX register numbers

`registernumber` `luatexbase.registernumber(<name>)`

Sometimes (notably in the case of Lua attributes) it is necessary to access a register *by number* that has been allocated by T_EX. This package provides a function to look up the relevant number using LuaT_EX’s internal tables. After for example `\newattribute\myattrib`, `\myattrib` would be defined by (say) `\myattrib=\attribute15`. `luatexbase.registernumber("myattrib")` would then return the register number, 15 in this case. If the string passed as argument does not correspond to a token defined by `\attributedef`, `\countdef` or similar commands, the Lua value `false` is returned.

As an example, consider the input:

```
\newcommand\test[1]{%
\typeout{#1: \expandafter\meaning\csname#1\endcsname^^J
\space\space\space\space
\directlua{tex.write(luatexbase.registernumber("#1") or "bad input")}}%
}

\test{undefinedrubbish}

\test{space}

\test{hbox}

\test{@MM}

\test{@tempdima}
\test{@tempdimb}

\test{strutbox}

\test{sixt@@n}

\attributedef\myattr=12
\myattr=200
\test{myattr}
```

If the demonstration code is processed with LuaL_AT_EX then the following would be produced in the log and terminal output.

```

undefinedrubbish: \relax
    bad input
space: macro:->
    bad input
hbox: \hbox
    bad input
@MM: \mathchar"4E20
    20000
@tempdima: \dimen14
    14
@tempdimb: \dimen15
    15
strutbox: \char"B
    11
sixt@@n: \char"10
    16
myattr: \attribute12
    12

```

Notice how undefined commands, or commands unrelated to registers do not produce an error, just return `false` and so print `bad input` here. Note also that commands defined by `\newbox` work and return the number of the box register even though the actual command holding this number is a `\chardef` defined token (there is no `\boxdef`).

4.3 Module utilities

`provides_module` `luatexbase.provides_module(<info>)`

This function is used by modules to identify themselves; the `info` should be a table containing information about the module. The required field `name` must contain the name of the module. It is recommended to provide a field `date` in the usual L^AT_EX format `yyyy/mm/dd`. Optional fields `version` (a string) and `description` may be used if present. This information will be recorded in the log. Other fields are ignored.

```

module_info    luatexbase.module_info(<module>, <text>)
module_warning luatexbase.module_warning(<module>, <text>)
module_error   luatexbase.module_error(<module>, <text>)

```

These functions are similar to L^AT_EX's `\PackageError`, `\PackageWarning` and `\PackageInfo` in the way they format the output. No automatic line breaking is done; you may still use `\n` as usual for that, and the name of the package will be prepended to each output line.

Note that `luatexbase.module_error` raises an actual Lua error with `error()`, which currently means a call stack will be dumped. While this may not look pretty, at least it provides useful information for tracking the error down.

4.4 Callback management

`add_to_callback` `luatexbase.add_to_callback(<callback>, <function>, <description>)` Registers the *<function>* into the *<callback>* with a textual *<description>* of the function. Functions are inserted into the callback in the order loaded.

`remove_from_callback` `luatexbase.remove_from_callback(<callback>, <description>)` Removes the call-

back function with $\langle description \rangle$ from the $\langle callback \rangle$. The removed function and its description are returned as the results of this function.

in_callback `luatexbase.in_callback($\langle callback \rangle$, $\langle description \rangle$)` Checks if the $\langle description \rangle$ matches one of the functions added to the list for the $\langle callback \rangle$, returning a boolean value.

disable_callback `luatexbase.disable_callback($\langle callback \rangle$)` Sets the $\langle callback \rangle$ to `false` as described in the LuaTeX manual for the underlying `callback.register` built-in. Callbacks will only be set to `false` (and thus be skipped entirely) if there are no functions registered using the callback.

callback_descriptions A list of the descriptions of functions registered to the specified callback is returned. `{}` is returned if there are no functions registered.

create_callback `luatexbase.create_callback($\langle name \rangle$, $\langle metatype \rangle$, $\langle default \rangle$)` Defines a user defined callback. The last argument is a default function or `false`.

call_callback `luatexbase.call_callback($\langle name \rangle$, ...)` Calls a user defined callback with the supplied arguments.

5 Implementation

```
1  $\langle *2ekernel | tex | latexrelease \rangle$ 
2  $\langle 2ekernel | latexrelease \rangle \ifx \directlua \@undefined \else$ 
```

5.1 Minimum LuaTeX version

LuaTeX has changed a lot over time. In the kernel support for ancient versions is not provided: trying to build a format with a very old binary therefore gives some information in the log and loading stops. The cut-off selected here relates to the tree-searching behaviour of `require()`: from version 0.60, LuaTeX will correctly find Lua files in the `texmf` tree without ‘help’.

```
3  $\langle latexrelease \rangle \backslash IncludeInRelease \{2015/10/01\}$ 
4  $\langle latexrelease \rangle \backslash newluafunction \{LuaTeX\} \%$ 
5  $\ifnum \luatexversion < 60 \%$ 
6    $\backslash wlog \{*****\}$ 
7    $\backslash wlog \{* LuaTeX version too old for l\luatex support *\}$ 
8    $\backslash wlog \{*****\}$ 
9    $\backslash expandafter \endinput$ 
10  $\fi$ 
```

Two simple L^AT_EX macros from `ltdfn.s.dtx` have to be defined here because `ltdfn.s.dtx` is not loaded yet when `l\luatex.dtx` is executed.

```
11  $\backslash long \def \gobble \#1 \{ \}$ 
12  $\backslash long \def \firstofone \#1 \{ \#1 \}$ 
```

5.2 Older L^AT_EX/Plain T_EX setup

```
13  $\langle *tex \rangle$ 
```

Older L^AT_EX formats don’t have the primitives with ‘native’ names: sort that out. If they already exist this will still be safe.

```
14  $\backslash directlua \{tex.enableprimitives("", tex.extraprimitives("luatex"))\}$ 
15  $\ifx \e@alloc \@undefined$ 
```

In pre-2014 L^AT_EX, or plain T_EX, load `etex.{sty,src}`.

```
16  $\ifx \documentclass \@undefined$ 
```

```

17 \ifx\loccount\@undefined
18 \input{etex.src}%
19 \fi
20 \catcode'\@=11 %
21 \outer\expandafter\def\csname newfam\endcsname
22 {\alloc@8\fam\chardef\et@xmaxfam}
23 \else
24 \RequirePackage{etex}
25 \expandafter\def\csname newfam\endcsname
26 {\alloc@8\fam\chardef\et@xmaxfam}
27 \expandafter\let\expandafter\new@mathgroup\csname newfam\endcsname
28 \fi

```

5.2.1 Fixes to etex.src/etex.sty

These could and probably should be made directly in an update to `etex.src` which already has some LuaTeX-specific code, but does not define the correct range for LuaTeX.

2015-07-13 higher range in luatex.

```

29 \edef \et@xmaxregs {\ifx\directlua\@undefined 32768\else 65536\fi}

```

luatex/xetex also allow more math fam.

```

30 \edef \et@xmaxfam {\ifx\Umathcode\@undefined\sixt@@n\else\ccclvi\fi}
31 \count 270=\et@xmaxregs % locally allocates \count registers
32 \count 271=\et@xmaxregs % ditto for \dimen registers
33 \count 272=\et@xmaxregs % ditto for \skip registers
34 \count 273=\et@xmaxregs % ditto for \muskip registers
35 \count 274=\et@xmaxregs % ditto for \box registers
36 \count 275=\et@xmaxregs % ditto for \toks registers
37 \count 276=\et@xmaxregs % ditto for \marks classes

```

and 256 or 16 fam. (Done above due to plain/LaTeX differences in `ltxuatex`.)

```

38 % \outer\def\newfam{\alloc@8\fam\chardef\et@xmaxfam}

```

End of proposed changes to `etex.src`

5.2.2 luatex specific settings

Switch to global cf `luatex.sty` to leave room for inserts not really needed for luatex but possibly most compatible with existing use.

```

39 \expandafter\let\csname newcount\expandafter\expandafter\endcsname
40 \csname globccount\endcsname
41 \expandafter\let\csname newdimen\expandafter\expandafter\endcsname
42 \csname globdimen\endcsname
43 \expandafter\let\csname newskip\expandafter\expandafter\endcsname
44 \csname globskip\endcsname
45 \expandafter\let\csname newbox\expandafter\expandafter\endcsname
46 \csname globbox\endcsname

```

Define `\e@alloc` as in latex (the existing macros in `etex.src` hard to extend to further register types as they assume specific 26x and 27x count range. For compatibility the existing register allocation is not changed.

```

47 \chardef\e@alloc@top=65535
48 \let\e@alloc\chardef

```

```

49 \def\@alloc#1#2#3#4#5#6{%
50   \global\advance#3\@ne
51   \@ch@ck{#3}{#4}{#5}#1%
52   \allocationnumber#3\relax
53   \global#2#6\allocationnumber
54   \wlog{\string#6=\string#1\the\allocationnumber}}%

55 \gdef\@ch@ck#1#2#3#4{%
56   \ifnum#1<#2\else
57     \ifnum#1=#2\relax
58       #1\@cclvi
59       \ifx\count#4\advance#1 10 \fi
60     \fi
61     \ifnum#1<#3\relax
62     \else
63       \errmessage{No room for a new \string#4}%
64     \fi
65   \fi}%

```

Fix up allocations not to clash with `etex.src`.

```

66 \expandafter\csname newcount\endcsname\@alloc@attribute@count
67 \expandafter\csname newcount\endcsname\@alloc@ccodetable@count
68 \expandafter\csname newcount\endcsname\@alloc@luafunction@count
69 \expandafter\csname newcount\endcsname\@alloc@whatsit@count
70 \expandafter\csname newcount\endcsname\@alloc@bytecode@count
71 \expandafter\csname newcount\endcsname\@alloc@luachunk@count

```

End of conditional setup for plain T_EX / old L^AT_EX.

```

72 \fi
73 \</tex>

```

5.3 Attributes

`\newattribute` As is generally the case for the LuaT_EX registers we start here from 1. Notably, some code assumes that `\attribute0` is never used so this is important in this case.

```

74 \ifx\@alloc@attribute@count\undefined
75   \countdef\@alloc@attribute@count=258
76   \@alloc@attribute@count=\z@
77 \fi
78 \def\newattribute#1{%
79   \@alloc\attribute\attributedef
80   \@alloc@attribute@count\m@ne\@alloc@top#1%
81 }

```

`\setattribute` Handy utilities.

```

\unsetattribute 82 \def\setattribute#1#2{#1=\numexpr#2\relax}
83 \def\unsetattribute#1{#1=-"7FFFFFFF\relax}

```

5.4 Category code tables

`\newcatcodetable` Category code tables are allocated with a limit half of that used by LuaT_EX for everything else. At the end of allocation there needs to be an initialization step.

Table 0 is already taken (it's the global one for current use) so the allocation starts at 1.

```

84 \ifx\@alloc\ccodetable@count\@undefined
85   \countdef\@alloc\ccodetable@count=259
86   \@alloc\ccodetable@count=\z@
87 \fi
88 \def\newcatcodetable#1{%
89   \@alloc\catcodetable\chardef
90   \@alloc\ccodetable@count\m@ne{"8000}\#1%
91   \initcatcodetable\allocationnumber
92 }

```

\catcodetable@initex Save a small set of standard tables. The Unicode data is read here in using a parser
 \catcodetable@string simplified from that in load-unicode-data: only the nature of letters needs to
 \catcodetable@latex be detected.

```

\catcodetable@atletter
93 \newcatcodetable\catcodetable@initex
94 \newcatcodetable\catcodetable@string
95 \begingroup
96   \def\setrangecatcode#1#2#3{%
97     \ifnum#1>#2 %
98       \expandafter\@gobble
99     \else
100       \expandafter\@firstofone
101     \fi
102     {%
103       \catcode#1=#3 %
104       \expandafter\setrangecatcode\expandafter
105       {\number\numexpr#1 + 1\relax}\#2}\#3}
106   }%
107 }

170      \savecatcodetable\catcodetable@atletter
171    }
172 \endgroup

```

5.5 Named Lua functions

`\newluafunction` Much the same story for allocating Lua_{TEX} functions except here they are just numbers so they are allocated in the same way as boxes. Lua indexes from 1 so once again slot 0 is skipped.

```

173 \ifx\e@alloc@luafunction@count\undefined
174   \countdef\e@alloc@luafunction@count=260
175   \e@alloc@luafunction@count=\z@
176 \fi
177 \def\newluafunction{%
178   \e@alloc@luafunction\e@alloc@chardef

```

```

179     \e@alloc@luafunction@count\m@ne\e@alloc@top
180 }

```

`\newluacmd` Additionally two variants are provided to make the passed control sequence call the function directly.

```

181 \def\newluacmd{%
182     \e@alloc\luafunction\luaodef
183     \e@alloc@luafunction@count\m@ne\e@alloc@top
184 }
185 \def\newprotectedluacmd{%
186     \e@alloc\luafunction{\protected\luaodef}
187     \e@alloc@luafunction@count\m@ne\e@alloc@top
188 }

```

5.6 Custom whatsits

`\newwhatsit` These are only settable from Lua but for consistency are definable here.

```

189 \ifx\e@alloc@whatsit@count\@undefined
190     \countdef\e@alloc@whatsit@count=261
191     \e@alloc@whatsit@count=\z@
192 \fi
193 \def\newwhatsit#1{%
194     \e@alloc\whatsit\e@alloc@chardef
195     \e@alloc@whatsit@count\m@ne\e@alloc@top#1%
196 }

```

5.7 Lua bytecode registers

`\newluabytcode` These are only settable from Lua but for consistency are definable here.

```

197 \ifx\e@alloc@bytecode@count\@undefined
198     \countdef\e@alloc@bytecode@count=262
199     \e@alloc@bytecode@count=\z@
200 \fi
201 \def\newluabytcode#1{%
202     \e@alloc\luabytcode\e@alloc@chardef
203     \e@alloc@bytecode@count\m@ne\e@alloc@top#1%
204 }

```

5.8 Lua chunk registers

`\newluachunkname` As for bytecode registers, but in addition we need to add a string to the `lua.name` table to use in stack tracing. We use the name of the command passed to the allocator, with no backslash.

```

205 \ifx\e@alloc@luachunk@count\@undefined
206     \countdef\e@alloc@luachunk@count=263
207     \e@alloc@luachunk@count=\z@
208 \fi
209 \def\newluachunkname#1{%
210     \e@alloc\luachunk\e@alloc@chardef
211     \e@alloc@luachunk@count\m@ne\e@alloc@top#1%
212     {\escapechar\m@ne
213     \directlua{lua.name[\the\allocationnumber]="\string#1"}}}%
214 }

```

5.9 Lua loader

Lua code loaded in the format often has to be loaded again at the beginning of every job, so we define a helper which allows us to avoid duplicated code:

```

215 \def\now@and@everyjob#1{%
216   \everyjob\expandafter{\the\everyjob
217     #1%
218   }%
219   #1%
220 }
```

Load the Lua code at the start of every job. For the conversion of T_EX into numbers at the Lua side we need some known registers: for convenience we use a set of systematic names, which means using a group around the Lua loader.

```

221 <2ekernel>\now@and@everyjob{%
222   \begingroup
223     \attributedef\attributezero=0 %
224     \chardef      \charzero      =0 %
```

Note name change required on older luatex, for hash table access.

```

225     \countdef      \CountZero    =0 %
226     \dimendef      \dimenzero    =0 %
227     \mathchardef    \mathcharzero =0 %
228     \muskipdef      \muskipzero   =0 %
229     \skipdef        \skipzero     =0 %
230     \toksdef        \tokszero     =0 %
231     \directlua{require("lualatex")}
232   \endgroup

```

5.10 Lua module preliminaries

```
287 <*lua>
```

Some set up for the Lua module which is needed for all of the Lua functionality added here.

luatexbase Set up the table for the returned functions. This is used to expose all of the public functions.

```

288 luatexbase      = luatexbase or { }
289 local luatexbase = luatexbase

```

Some Lua best practice: use local versions of functions where possible.

```

290 local string_gsub      = string.gsub
291 local tex_count        = tex.count
292 local tex_setattribute = tex.setattribute
293 local tex_setcount     = tex.setcount
294 local texio_write_nl   = texio.write_nl
295 local flush_list       = node.flush_list
296 local luatexbase_warning
297 local luatexbase_error

```

5.11 Lua module utilities

5.11.1 Module tracking

modules To allow tracking of module usage, a structure is provided to store information and to return it.

```
298 local modules = modules or { }
```

provides_module Local function to write to the log.

```
299 local function luatexbase_log(text)
300   texio_write_nl("log", text)
301 end
```

Modelled on `\ProvidesPackage`, we store much the same information but with a little more structure.

```
302 local function provides_module(info)
303   if not (info and info.name) then
304     luatexbase_error("Missing module name for provides_module")
305   end
306   local function spaced(text)
307     return text and (" " .. text) or ""
308   end
309   luatexbase_log(
310     "Lua module: " .. info.name
311     .. spaced(info.date)
312     .. spaced(info.version)
313     .. spaced(info.description)
314   )
315   modules[info.name] = info
316 end
317 luatexbase.provides_module = provides_module
```

5.11.2 Module messages

There are various warnings and errors that need to be given. For warnings we can get exactly the same formatting as from `TEX`. For errors we have to make some changes. Here we give the text of the error in the `LATEX` format then force an error from Lua to halt the run. Splitting the message text is done using `\n` which takes the place of `\MessageBreak`.

First an auxiliary for the formatting: this measures up the message leader so we always get the correct indent.

```
318 local function msg_format(mod, msg_type, text)
319   local leader = ""
320   local cont
321   local first_head
322   if mod == "LaTeX" then
323     cont = string_gsub(leader, ".", " ")
324     first_head = leader .. "LaTeX: "
325   else
326     first_head = leader .. "Module " .. msg_type
327     cont = "(" .. mod .. ")"
328     .. string_gsub(first_head, ".", " ")
329     first_head = leader .. "Module " .. mod .. " " .. msg_type .. ":"
330   end
```

```

331 if msg_type == "Error" then
332     first_head = "\n" .. first_head
333 end
334 if string.sub(text,-1) ~= "\n" then
335     text = text .. " "
336 end
337 return first_head .. " "
338     .. string_gsub(
339         text
340     .. "on input line "
341         .. tex.inputlineno, "\n", "\n" .. cont .. " "
342     )
343     .. "\n"
344 end

module_info Write messages.
module_warning 345 local function module_info(mod, text)
module_error 346     texio_write_nl("log", msg_format(mod, "Info", text))
347 end
348 luatexbase.module_info = module_info
349 local function module_warning(mod, text)
350     texio_write_nl("term and log", msg_format(mod, "Warning", text))
351 end
352 luatexbase.module_warning = module_warning
353 local function module_error(mod, text)
354     error(msg_format(mod, "Error", text))
355 end
356 luatexbase.module_error = module_error

Dedicated versions for the rest of the code here.
357 function luatexbase_warning(text)
358     module_warning("luatexbase", text)
359 end
360 function luatexbase_error(text)
361     module_error("luatexbase", text)
362 end

```

5.12 Accessing register numbers from Lua

Collect up the data from the T_EX level into a Lua table: from version 0.80, LuaT_EX makes that easy.

```

363 local luaregisterbasetable = { }
364 local registermap = {
365     attributezero = "assign_attr"    ,
366     charzero      = "char_given"    ,
367     CountZero     = "assign_int"     ,
368     dimenzero     = "assign_dimen"   ,
369     mathcharzero  = "math_given"     ,
370     muskipzero    = "assign_mu_skip" ,
371     skipzero      = "assign_skip"    ,
372     tokszero      = "assign_toks"    ,
373 }
374 local createtoken

```

```

375 if tex.luatexversion > 81 then
376   createtoken = token.create
377 elseif tex.luatexversion > 79 then
378   createtoken = newtoken.create
379 end
380 local hashtokens    = tex.hashtokens()
381 local luatexversion = tex.luatexversion
382 for i,j in pairs (registermap) do
383   if luatexversion < 80 then
384     luaregisterbasetable[hashtokens[i][1]] =
385       hashtokens[i][2]
386   else
387     luaregisterbasetable[j] = createtoken(i).mode
388   end
389 end

```

registernumber Working out the correct return value can be done in two ways. For older LuaTeX releases it has to be extracted from the `hashtokens`. On the other hand, newer LuaTeX's have `newtoken`, and whilst `.mode` isn't currently documented, Hans Hagen pointed to this approach so we should be OK.

```

390 local registernumber
391 if luatexversion < 80 then
392   function registernumber(name)
393     local nt = hashtokens[name]
394     if(nt and luaregisterbasetable[nt[1]]) then
395       return nt[2] - luaregisterbasetable[nt[1]]
396     else
397       return false
398     end
399   end
400 else
401   function registernumber(name)
402     local nt = createtoken(name)
403     if(luaregisterbasetable[nt.cmdname]) then
404       return nt.mode - luaregisterbasetable[nt.cmdname]
405     else
406       return false
407     end
408   end
409 end
410 luatexbase.registernumber = registernumber

```

5.13 Attribute allocation

new_attribute As attributes are used for Lua manipulations its useful to be able to assign from this end.

```

411 local attributes=setmetatable(
412 {}),
413 {
414   __index = function(t,key)
415     return registernumber(key) or nil
416   end}
417 )

```

```

418 luatexbase.attributes = attributes
419 local attribute_count_name =
420     attribute_count_name or "e@alloc@attribute@count"
421 local function new_attribute(name)
422     tex_setcount("global", attribute_count_name,
423         tex_count[attribute_count_name] + 1)
424     if tex_count[attribute_count_name] > 65534 then
425         luatexbase_error("No room for a new \\attribute")
426     end
427     attributes[name] = tex_count[attribute_count_name]

429         tex_count[attribute_count_name])
430     return tex_count[attribute_count_name]
431 end
432 luatexbase.new_attribute = new_attribute

```

5.14 Custom whatsit allocation

`new_whatsit` Much the same as for attribute allocation in Lua.

```

433 local whatsit_count_name = whatsit_count_name or "e@alloc@whatsit@count"
434 local function new_whatsit(name)
435     tex_setcount("global", whatsit_count_name,
436         tex_count[whatsit_count_name] + 1)
437     if tex_count[whatsit_count_name] > 65534 then
438         luatexbase_error("No room for a new custom whatsit")
439     end
440     luatexbase_log("Custom whatsit " .. (name or "") .. " = " ..
441         tex_count[whatsit_count_name])
442     return tex_count[whatsit_count_name]
443 end
444 luatexbase.new_whatsit = new_whatsit

```

5.15 Bytecode register allocation

`new_bytecode` Much the same as for attribute allocation in Lua. The optional *<name>* argument is used in the log if given.

```

445 local bytecode_count_name =
446     bytecode_count_name or "e@alloc@bytecode@count"
447 local function new_bytecode(name)
448     tex_setcount("global", bytecode_count_name,
449         tex_count[bytecode_count_name] + 1)
450     if tex_count[bytecode_count_name] > 65534 then
451         luatexbase_error("No room for a new bytecode register")
452     end
453     luatexbase_log("Lua bytecode " .. (name or "") .. " = " ..
454         tex_count[bytecode_count_name])
455     return tex_count[bytecode_count_name]
456 end
457 luatexbase.new_bytecode = new_bytecode

```

5.16 Lua chunk name allocation

`new_chunkname` As for bytecode registers but also store the name in the `lua.name` table.

```
458 local chunkname_count_name =
459     chunkname_count_name or "e@alloc@luachunk@count"
460 local function new_chunkname(name)
461     tex_setcount("global", chunkname_count_name,
462         tex_count[chunkname_count_name] + 1)
463     local chunkname_count = tex_count[chunkname_count_name]
464     chunkname_count = chunkname_count + 1
465     if chunkname_count > 65534 then
466         luatexbase_error("No room for a new chunkname")
467     end
468     lua.name[chunkname_count]=name
469     luatexbase_log("Lua chunkname " .. (name or "") .. " = " ..
470         chunkname_count .. "\n")
471     return chunkname_count
472 end
473 luatexbase.new_chunkname = new_chunkname
```

5.17 Lua function allocation

`new_luafunction` Much the same as for attribute allocation in Lua. The optional `<name>` argument is used in the log if given.

```
474 local luafunction_count_name =
475     luafunction_count_name or "e@alloc@luafunction@count"
476 local function new_luafunction(name)
477     tex_setcount("global", luafunction_count_name,
478         tex_count[luafunction_count_name] + 1)
479     if tex_count[luafunction_count_name] > 65534 then
480         luatexbase_error("No room for a new luafunction register")
481     end
482     luatexbase_log("Lua function " .. (name or "") .. " = " ..
483         tex_count[luafunction_count_name])
484     return tex_count[luafunction_count_name]
485 end
486 luatexbase.new_luafunction = new_luafunction
```

5.18 Lua callback management

The native mechanism for callbacks in LuaT_EX allows only one per function. That is extremely restrictive and so a mechanism is needed to add and remove callbacks from the appropriate hooks.

5.18.1 Housekeeping

The main table: keys are callback names, and values are the associated lists of functions. More precisely, the entries in the list are tables holding the actual function as `func` and the identifying description as `description`. Only callbacks with a non-empty list of functions have an entry in this list.

```
487 local callbacklist = callbacklist or { }
```

Numerical codes for callback types, and name-to-value association (the table keys are strings, the values are numbers).

```

488 local list, data, exclusive, simple, reverselist = 1, 2, 3, 4, 5
489 local types = {
490   list      = list,
491   data      = data,
492   exclusive = exclusive,
493   simple    = simple,
494   reverselist = reverselist,
495 }

```

Now, list all predefined callbacks with their current type, based on the LuaTeX manual version 1.01. A full list of the currently-available callbacks can be obtained using

```

\directlua{
  for i,_ in pairs(callback.list()) do
    texio.write_nl("- " .. i)
  end
}
\bye

```

in plain LuaTeX. (Some undocumented callbacks are omitted as they are to be removed.)

```

496 local callbacktypes = callbacktypes or {

```

Section 8.2: file discovery callbacks.

```

497   find_read_file      = exclusive,
498   find_write_file     = exclusive,

```

567 glyph_info                = exclusive,
568 glyph_not_found           = exclusive,
569 glyph_stream_provider      = exclusive,
570 make_extensible            = exclusive,
571 font_descriptor_objnum_provider = exclusive,
572 input_level_string          = exclusive,
573 provide_charproc_data       = exclusive,
574 }
575 luatexbase.callbacktypes=callbacktypes

```

callback.register Save the original function for registering callbacks and prevent the original being used. The original is saved in a place that remains available so other more sophisticated code can override the approach taken by the kernel if desired.

```

576 local callback_register = callback_register or callback.register
577 function callback.register()
578   luatexbase_error("Attempt to use callback.register() directly\n")
579 end

```

5.18.2 Handlers

The handler function is registered into the callback when the first function is added to this callback's list. Then, when the callback is called, the handler takes care of running all functions in the list. When the last function is removed from the callback's list, the handler is unregistered.

More precisely, the functions below are used to generate a specialized function (closure) for a given callback, which is the actual handler.

The way the functions are combined together depends on the type of the callback. There are currently 4 types of callback, depending on the calling convention of the functions the callback can hold:

simple is for functions that don't return anything: they are called in order, all with the same argument;

data is for functions receiving a piece of data of any type except node list head (and possibly other arguments) and returning it (possibly modified): the functions are called in order, and each is passed the return value of the previous (and the other arguments untouched, if any). The return value is that of the last function;

list is a specialized variant of *data* for functions filtering node lists. Such functions may return either the head of a modified node list, or the boolean values **true** or **false**. The functions are chained the same way as for *data* except that for the following. If one function returns **false**, then **false** is immediately returned and the following functions are *not* called. If one function returns **true**, then the same head is passed to the next function. If all functions return **true**, then **true** is returned, otherwise the return value of the last function not returning **true** is used.

reverselist is a specialized variant of *list* which executes functions in inverse order.

exclusive is for functions with more complex signatures; functions in this type of callback are *not* combined: An error is raised if a second callback is registered.

Handler for **data** callbacks.

```
580 local function data_handler(name)
581   return function(data, ...)
582     for _,i in ipairs(callbacklist[name]) do
583       data = i.func(data,...)
584     end
585     return data
586   end
587 end
```

Default for user-defined **data** callbacks without explicit default.

```
588 local function data_handler_default(value)
589   return value
590 end
```

Handler for **exclusive** callbacks. We can assume `callbacklist[name]` is not empty: otherwise, the function wouldn't be registered in the callback any more.

```
591 local function exclusive_handler(name)
592   return function(...)
593     return callbacklist[name][1].func(...)
594   end
595 end
```

Handler for **list** callbacks.

```
596 local function list_handler(name)
597   return function(head, ...)
598     local ret
599     for _,i in ipairs(callbacklist[name]) do
600       ret = i.func(head, ...)
601       if ret == false then
602         luatexbase_warning(
603           "Function '" .. i.description .. "' returned false\n"
604           .. "in callback '" .. name .. "'")
605       )
606       return false
607     end
608     if ret ~= true then
609       head = ret
610     end
611   end
612   return head
613 end
614 end
```

Default for user-defined **list** and **reverselist** callbacks without explicit default.

```
615 local function list_handler_default(head)
616   return head
617 end
```

Handler for **reverselist** callbacks.

```
618 local function reverselist_handler(name)
619   return function(head, ...)
```

```

620     local ret
621     local callbacks = callbacklist[name]
622     for i = #callbacks, 1, -1 do
623         local cb = callbacks[i]
624         ret = cb.func(head, ...)
625         if ret == false then
626             luatexbase_warning(
627                 "Function '" .. cb.description .. "' returned false\n"
628                 .. "in callback '" .. name .. "'")
629         )
630         return false
631     end
632     if ret ~= true then
633         head = ret
634     end
635 end
636 return head
637 end
638 end

```

Handler for simple callbacks.

```

639 local function simple_handler(name)
640     return function(...)
641         for _,i in ipairs(callbacklist[name]) do
642             i.func(...)
643         end
644     end
645 end

```

Default for user-defined simple callbacks without explicit default.

```

646 local function simple_handler_default()
647 end

```

Keep a handlers table for indexed access and a table with the corresponding default functions.

```

648 local handlers = {
649     [data] = data_handler,
650     [exclusive] = exclusive_handler,
651     [list] = list_handler,
652     [reverselist] = reverselist_handler,
653     [simple] = simple_handler,
654 }
655 local defaults = {
656     [data] = data_handler_default,
657     [exclusive] = nil,
658     [list] = list_handler_default,
659     [reverselist] = list_handler_default,
660     [simple] = simple_handler_default,
661 }

```

5.18.3 Public functions for callback management

Defining user callbacks perhaps should be in package code, but impacts on `add_to_callback`. If a default function is not required, it may be declared as `false`. First we need a list of user callbacks.

```

662 local user_callbacks_defaults = {
663   pre_mlist_to_hlist_filter = list_handler_default,
664   mlist_to_hlist = node.mlist_to_hlist,
665   post_mlist_to_hlist_filter = list_handler_default,
666 }

```

create_callback The allocator itself.

```

667 local function create_callback(name, ctype, default)
668   local ctype_id = types[ctype]
669   if not name or name == ""
670   or not ctype_id
671   then
672     luatexbase_error("Unable to create callback:\n" ..
673                       "valid callback name and type required")
674   end
675   if callbacktypes[name] then
676     luatexbase_error("Unable to create callback '" .. name ..
677                       "':\ncallback is already defined")
678   end
679   default = default or defaults[ctype_id]
680   if not default then
681     luatexbase_error("Unable to create callback '" .. name ..
682                       "':\ndefault is required for '" .. ctype ..
683                       "' callbacks")
684   elseif type(default) ~= "function" then
685     luatexbase_error("Unable to create callback '" .. name ..
686                       "':\ndefault is not a function")
687   end
688   user_callbacks_defaults[name] = default
689   callbacktypes[name] = ctype_id
690 end
691 luatexbase.create_callback = create_callback

```

call_callback Call a user defined callback. First check arguments.

```

692 local function call_callback(name,...)
693   if not name or name == "" then
694     luatexbase_error("Unable to create callback:\n" ..
695                       "valid callback name required")
696   end
697   if user_callbacks_defaults[name] == nil then
698     luatexbase_error("Unable to call callback '" .. name
699                       .. "':\nunknown or empty")
700   end
701   local l = callbacklist[name]
702   local f
703   if not l then
704     f = user_callbacks_defaults[name]
705   else
706     f = handlers[callbacktypes[name]](name)
707   end
708   return f(...)
709 end
710 luatexbase.call_callback=call_callback

```

`add_to_callback` Add a function to a callback. First check arguments.

```
711 local function add_to_callback(name, func, description)
712   if not name or name == "" then
713     luatexbase_error("Unable to register callback:\n" ..
714       "valid callback name required")
715   end
716   if not callbacktypes[name] or
717     type(func) ~= "function" or
718     not description or
719     description == "" then
720     luatexbase_error(
721       "Unable to register callback.\n\n"
722       .. "Correct usage:\n"
723       .. "add_to_callback(<callback>, <function>, <description>)"
724     )
725   end
```

Then test if this callback is already in use. If not, initialise its list and register the proper handler.

```
726   local l = callbacklist[name]
727   if l == nil then
728     l = { }
729     callbacklist[name] = l
```

If it is not a user defined callback use the primitive callback register.

```
730   if user_callbacks_defaults[name] == nil then
731     callback_register(name, handlers[callbacktypes[name]](name))
732   end
733 end
```

Actually register the function and give an error if more than one `exclusive` one is registered.

```
734   local f = {
735     func      = func,
736     description = description,
737   }
738   local priority = #l + 1
739   if callbacktypes[name] == exclusive then
740     if #l == 1 then
741       luatexbase_error(
742         "Cannot add second callback to exclusive function\n'" ..
743         name .. "'"")
744     end
745   end
746   table.insert(l, priority, f)
```

Keep user informed.

```
747   luatexbase_log(
748     "Inserting '" .. description .. "' at position "
749     .. priority .. " in '" .. name .. "'")
750 )
751 end
752 luatexbase.add_to_callback = add_to_callback
```

`remove_from_callback` Remove a function from a callback. First check arguments.

```

753 local function remove_from_callback(name, description)
754   if not name or name == "" then
755     luatexbase_error("Unable to remove function from callback:\n" ..
756                       "valid callback name required")
757   end
758   if not callbacktypes[name] or
759     not description or
760     description == "" then

762       "Unable to remove function from callback.\n\n"
763       .. "Correct usage:\n"

765     )
766   end
767   local l = callbacklist[name]
768   if not l then
769     luatexbase_error(
770       "No callback list for '" .. name .. "'\n")
771   end

```

Loop over the callback's function list until we find a matching entry. Remove it and check if the list is empty: if so, unregister the callback handler.

```

772   local index = false
773   for i,j in ipairs(l) do
774     if j.description == description then
775       index = i
776       break
777     end
778   end
779   if not index then
780     luatexbase_error(
781       "No callback '" .. description .. "' registered for '" ..
782       name .. "'\n")
783   end
784   local cb = l[index]
785   table.remove(l, index)
786   luatexbase_log(
787     "Removing '" .. description .. "' from '" .. name .. "'."
788   )
789   if #l == 0 then
790     callbacklist[name] = nil
791     if user_callbacks_defaults[name] == nil then
792       callback_register(name, nil)
793     end
794   end
795   return cb.func,cb.description
796 end
797 luatexbase.remove_from_callback = remove_from_callback

```

in_callback Look for a function description in a callback.

```

798 local function in_callback(name, description)
799   if not name
800     or name == ""
801     or not callbacklist[name]

```

```

802     or not callbacktypes[name]
803     or not description then
804         return false
805     end
806     for _, i in pairs(callbacklist[name]) do
807         if i.description == description then
808             return true
809         end
810     end
811     return false
812 end
813 luatexbase.in_callback = in_callback

```

disable_callback As we subvert the engine interface we need to provide a way to access this functionality.

```

814 local function disable_callback(name)
815     if(callbacklist[name] == nil) then
816         callback_register(name, false)
817     else
818         luatexbase_error("Callback list for " .. name .. " not empty")
819     end
820 end
821 luatexbase.disable_callback = disable_callback

```

callback_descriptions List the descriptions of functions registered for the given callback.

```

822 local function callback_descriptions (name)
823     local d = {}
824     if not name
825         or name == ""
826         or not callbacklist[name]
827         or not callbacktypes[name]
828     then
829         return d
830     else
831         for k, i in pairs(callbacklist[name]) do
832             d[k] = i.description
833         end
834     end
835     return d
836 end
837 luatexbase.callback_descriptions = callback_descriptions

```

uninstall Unlike at the T_EX level, we have to provide a back-out mechanism here at the same time as the rest of the code. This is not meant for use by anything other than `latexrelease`: as such this is *deliberately* not documented for users!

```

838 local function uninstall()
839     module_info(
840         "luatexbase",
841         "Uninstalling kernel luatexbase code"
842     )
843     callback.register = callback_register
844     luatexbase = nil
845 end
846 luatexbase.uninstall = uninstall

```

`mlist_to_hlist` To emulate these callbacks, the “real” `mlist_to_hlist` is replaced by a wrapper calling the wrappers before and after.

```
847 callback_register("mlist_to_hlist", function(head, display_type, need_penalties)
848   local current = call_callback("pre_mlist_to_hlist_filter", head, display_type, need_penalties)
849   if current == false then
850     flush_list(head)
851     return nil
852   end
853   current = call_callback("mlist_to_hlist", current, display_type, need_penalties)
854   local post = call_callback("post_mlist_to_hlist_filter", current, display_type, need_penalties)
855   if post == false then
856     flush_list(current)
857     return nil
858   end
859   return post
860 end)
```

861 `</lua>`

Reset the catcode of `@`.

862 `<tex>\catcode'\@=\etacatcode\relax`
