\default@ds The default option code. Set by \@onefilewithoptions to either \OptionNotUsed for classes, or \@unknownoptionerror for packages. This may be reset in either case with \DeclareOption*.

```
473 % \let\default@ds\OptionNotUsed
```

(End of definition for \default@ds.)

\ProcessOptions \ProcessOptions calls \ds@option for each known package option, then calls \default@ds for each option on the local options list. Finally resets all the declared options to \relax. The empty option does nothing, this has to be reset on the off chance it's set to \relax if an empty element gets into the \@declaredoptions list.

The star form is similar but executes options given in the order specified in the document, not the order they are declared in the file. In the case of packages, global options are executed before local ones.

```

Then we do some work.

First of all, we define the global variables. Then we look to see if the file has already been loaded. If it has, we check that it was first loaded with at least the current options. If it has not, we add the current options to the package options, set the default version to be 0000/00/00, and load the file if we can find it. Then we check the version number.

Finally, we restore the old file name, reset the default option, and we set the catcode of @.

For classes, we can immediately process the file. For other types, #2 could be a comma separated list, so loop through, processing each one separately.

```

This macro is used when loading packages or classes.

`\load@onefilewithoptions` Have the main argument as #1, so we only need one `\expandafter` above.

```

810 </2ekernel>
811 <*2ekernel | latexrelease>
812 <latexrelease>\IncludeInRelease{2020/10/01}%
813 <latexrelease> {\@onefilewithoptions}{Hooks and unused options issue}%

```

Here this macro is called `\@onefilewithoptions`, but further ahead in this file it is renamed to `\load@onefilewithoptions`, and `\@onefilewithoptions` becomes a wrapper around this, used for bookkeeping when rolling back. Therefore, when in `latexrelease`, we need to define `\load@onefilewithoptions` instead, thus the extra guarded `\def` line below:

```

814 <*2ekernel>
815 \def\@onefilewithoptions#1[#2][#3]#4{%
816 </2ekernel>
817 <latexrelease>\def\load@onefilewithoptions#1[#2][#3]#4{%

```

We have to sanitise file names, so that something like

```

\usepackage{some/local/path/array}
\usepackage{array}

```

won't load `array.sty` twice. It is remotely possible that those are two different files, but as a matter of principles, we will consider that the base file name uniquely identifies a package, regardless of where it lives. This assumption already holds for file hooks, for example, which address the hook to a file by its base name only.

We'll use `\@expl@@@filehook@set@curr@file@@nNN` to parse the file name and return the `<path>` and `<base+ext>` in separate token lists. Further ahead, most operations use `\@currname` which doesn't have a path attached to it; only few actions prepend `\@currpath` to `\@currname` (namely loading, as we have to respect the given path).

A file substitution isn't followed just yet because at this point we are parsing user input, so the file is still what the user asked for, and not the file actually loaded.

```

818 \@expl@@@filehook@set@curr@file@@nNN{#1.#4}\reserved@a\reserved@b
819 \edef\reserved@c{\def\noexpand\reserved@c####1%

```

```

820 \detokenize\expandafter{\expanded{. #4}}%
821 \noexpand\@nil{\def\noexpand\reserved@a{####1}}\reserved@c
822 \expandafter\reserved@c\reserved@a\@nil
823 \@pushfilename
824 \xdef\@currname{\string\makeletter\reserved@a}%
825 \xdef\@currpath{\ifx\reserved@b\@empty\else\reserved@b\fi}%
826 \global\let\@currentx#4%

```

The command `\ver@<file>.<ext>` is used to signal that a package is already loaded, either because it is in fact loaded, or because its loading was suppressed. In minimal installations, said package may not exist but still have its loading suppressed with `\ver@<file>.<ext>`, so before checking if the file exists we have to check that we do need to load it with `\@ifl@aded`. If we don't, then there's no point in checking for a typo or load-disabling.

```

827 \@ifl@aded\@currentx\@currname

```

In the current preferred approach, a key family name will exist for processing using `ltkeys`. In that case, we replace the previous package options with the new ones, then call the key handler. Otherwise, we use the more classical clash handler.

```

828 {%
829 \@ifundefined{opt@handler@\@currname.\@currentx}
830 {\@onefilewithoptions@clashchk{#2}}
831 {%
832 \expandafter\protected@edef\csname opt@\@currname.\@currentx\endcsname
833 {\zap@space#2 \@empty}%
834 \@namedef{@raw@opt@\@currname.\@currentx}{#2}%
835 \@nameuse{opt@handler@\@currname.\@currentx}%
836 }%
837 }%
838 {\makeatletter

```

The next line seems to be necessary for 2.09 compatibility (the way the code is written there) This seems questionable and should be look at as in 2e it is definitely unnecessary at this point!

```

839 \@reset@ptions

```

First we take the `<name>` and `<ext>` given in the argument and check if the file exists, and issue an error otherwise asking for a correction with `\@missingfileerror`. For checking if the file exists we use `\@currpath` (usually empty) before `\@currname`.

```

840 \IfFileExists{\@currpath\@currname.\@currentx}{}%
841 {\@missing@onefilewithoptions{#2}}%

```

If `\@currname` is empty (the user replied to the “Enter file name” prompt with `<RETURN>`), so stop here (do `\@popfilename` to pop the item just added above).

This `\@gobble` omits the date check at the end.

```

842 \ifx\@currname\@empty
843 \expandafter\@gobble
844 \else

```

If the file exists, check if it was load-prevented, and otherwise do the bookkeeping with `\@filehook@file@push` then call `\set@curr@file` to set `\@curr@file` (and do any required substitution), then actually load the class/package with `\load@onefile@withoptions`. `\set@curr@file` also needs the file path.

```

845 \@disable@packageload@do{\@currname.\@currentx}%

```

```

846      {\expl@@@filehook@file@push@@
847      \set@curr@file{\@currpath\@currname.\@currentx}%
848      \@filehook@set@CurrentFile

```

The `\set@curr@file` line above might have replaced the file, so `\@currname` and `\@currentx` may no longer hold the actual package being loaded, so in that case we need to update these two token lists (`\@curr@file` holds the file name after replacement, so we parse that).

The requested file is saved in `\@currpkg@reqd` to be used in `\InputIfFileExists` later: if the updated `\@currname` and `\@currentx` are used we lose track of the substitution, so `\CurrentFile` and `\CurrentFileUsed` will be (incorrectly) the same.

```

849      \expandafter\@swaptwoargs\expandafter
850      {\expandafter{\@currpkg@reqd}}%
851      {% <

```

`\@currpkg@reqd` doesn't take a path because it is used later to assign `\opt@...` and `\ver@...`.

```

852      \edef\@currpkg@reqd{\@currname.\@currentx}%
853      \ifx\CurrentFile\CurrentFileUsed
854      \else
855      \filename@parse\@curr@file
856      \edef\@currpath{\string@makeletter\filename@area}%
857      \edef\@currname{\string@makeletter\filename@base}%
858      \edef\@currentx{\string@makeletter\filename@ext}%
859      \fi
860      \load@onefile@withoptions{#2}%
861      \def\@currpkg@reqd%\@currpkg@reqd{
862      }% >

```

Now just clean up and exit.

```

863      \expl@@@filehook@file@pop@@}%
864      \expandafter\@firstofone
865      \fi}%

```

Except in the case where `\@currname` is empty, the date is checked against the date marked in the package file:

```

866      {\@ifl@ter\@currentx{\@currname}{#3}{}}%
867      {\@latex@warning@no@line
868      {You have requested,\on@line,
869      version\MessageBreak
870      ‘#3’ of \@cls@pkg\space \@currname,\MessageBreak
871      but only version\MessageBreak
872      ‘\csname ver@\@currname.\@currentx\endcsname’\MessageBreak
873      is available}}}%
874      \ifx\@currentx\@clsextension\let\LoadClass\@twoloadclasserror\fi}%
875      \@popfilename
876      \@reset@options}

```

If the package is already loaded, check that there were no option clashes.

```

877      \def\@onefilewithoptions@clashchk#1{%
\@onefilewithoptions@clashchk

889         \@optionlist{\@currname.\@current},#1\MessageBreak
890         to your \noexpand\documentclass declaration may fix this.%
891         \MessageBreak
892         Try typing \space <return> \space to proceed.}}%
893     \@firstofone}

894 \let\@currpkg@reqd\@empty

895 \@onlypreamble\@onefilewithoptions

    The kernel no longer uses \@unprocessedoptions
896 \let\@unprocessedoptions\@undefined

```

Now the action taken when a file is not found. Path must be included here as it eventually leads to a file lookup.

```

\@missing@onefilewithoptions
897 \def\@missing@onefilewithoptions#1{%
898     \@missingfileerror{\@currpath\@currname}\@current
899     \global\let\@currpath\@missingfile@area
900     \global\let\@currname\@missingfile@base
901     \global\let\@current\@missingfile@ext}

```

Now the code that actually does the file loading:

```

\load@onefile@withoptions
902 \def\load@onefile@withoptions#1{%
903     \let\CurrentOption\@empty
904     \@reset@options

```

Grab everything in a macro, so the parameter stack is popped before any processing begins.

```

905     \def\reserved@a{%
906         \@pass@options\@current{#1}{\@currname}%

907     \expandafter\let
908         \csname opt@\@currpkg@reqd\expandafter\endcsname
909         \csname opt@\@currname.\@current\endcsname
910     \expandafter\let
911         \csname @raw@opt@\@currpkg@reqd\expandafter\endcsname
912         \csname @raw@opt@\@currname.\@current\endcsname
913     \global\expandafter
914     \let\csname ver@\@currname.\@current\endcsname\@empty

```

We initialize \...-h@@k here and only if we load the file so that it remains undefined otherwise.

```

915     \expandafter\let\csname\@currname.\@current-h@@k\endcsname\@empty

```

When the current extension is \@pkgextension we are loading a package otherwise, if it is \@clsextension, a class, so depending on that we execute different hooks. If the extension is neither, then it is another type of file without special hooks.

```

916 %-----
917 \ifx\@current\@pkgextension

```

```

918     \UseHook{package/before}%
919     \UseOneTimeHook{package/\@currname/before}%
920   \else
921     \ifx\@currentx\@clsextension
922       \UseHook{class/before}%
923       \UseOneTimeHook{class/\@currname/before}%
924     \fi
925   \fi

```

Now actually load the file (at this point we are certain it exists, but use `\InputIfFileExists` so that file hooks are executed). `\@currpath` is needed here too.

```

926     \InputIfFileExists{\@currpath\@currpkg@reqd}{}%
927     {\@latex@error
928       {The \@cls@pkg\space\@currpkg@reqd\space failed to load}\@ehd}%
929   %-----

```

In older versions of the code `\@unprocessedoptions` would generate an error for each specified option in a package unless a `\ProcessOptions` has appeared in the package file.

This has changed in 2020. We now use a separate macro per package to avoid interference in case of nested packages. The whole code for handling this issue (GitHub 22) was provided by Hironobu Yamashita, thanks for that.

```

930     \expandafter\let\csname unprocessedoptions-\@currname.\@currentx\endcsname
931         \@unprocessedoptions
932     \csname\@currname.\@currentx-h@@k\endcsname
933     \expandafter\let\csname\@currname.\@currentx-h@@k\endcsname
934         \@undefined

```

Catch the case where the packages has handled the options and redefined `\@unprocessedoptions` to `\relax` (old interface). In that case no error should be produced.

```

935     \ifx\@unprocessedoptions\relax
936       \let\@unprocessedoptions\@undefined

```

Otherwise run the per package set of unused options.

```

937   \else
938     \csname unprocessedoptions-\@currname.\@currentx\endcsname
939   \fi

```

In either case we drop the macro afterwards as it is no longer needed.

```

940     \expandafter\let
941         \csname unprocessedoptions-\@currname.\@currentx\endcsname
942         \@undefined

```

And same procedure, James, when we are finished loading, except that the hook order is now reversed.

```

943   %-----
944     \ifx\@currentx\@pkgextension
945       \UseOneTimeHook{package/\@currname/after}%
946       \UseHook{package/after}%
947     \else
948       \ifx\@currentx\@clsextension
949         \UseOneTimeHook{class/\@currname/after}%
950         \UseHook{class/after}%
951       \fi
952     \fi}%
953   %-----

```

```
954 \ifl@aded\@current\@currname{}\reserved@a}}
```

Now declare the non-generic package and class hooks used above:

```
955 \NewHook{package/before}
956 \NewHook{class/before}
957 \NewReversedHook{package/after}
958 \NewReversedHook{class/after}

959 </2ekernel | latexrelease>

5 Package/class rollback mechanism

```

1480 \*2ekernel)
1481 \*2ekernel | latexreleasefirst)

```

\pkgcls@debug For testing we have a few extra lines of code that by default do nothing but one can set \pkgcls@debug to \typeout to get extra info. Sometime in the future this will be dropped.

```

1482 \*tracerollback)

```

```

1483 %\let\pkgcls@debug\typeout
1484 \let\pkgcls@debug@gobble
1485 \traceroollback

```

(End of definition for \pkgcls@debug.)

\requestedLaTeXdate The macro (!) **\requestedLaTeXdate** holds the globally requested rollback date (via **latexrelease**) or zero if no such request was made.

```

1486 \def\requestedLaTeXdate{0}

```

(End of definition for \requestedLaTeXdate.)

\pkgcls@targetdate If a rollback for a package or class is requested then **\pkgcls@targetdate** holds the requested date as a number YYYYMMDD (if there was one, otherwise the value of **\requestedLaTeXdate**) and **\pkgcls@targetlabel** will be empty. If there was a request for a named version then **\pkgcls@targetlabel** holds the version name and **\pkgcls@targetdate** is set to 1.

\pkgcls@targetdate=0 is used to indicate that there was no rollback request. While loading an old release **\pkgcls@targetdate** is also reset to zero so that **\DeclareRelease** declarations are bypassed.

In contrast **\pkgcls@innerdate** will always hold the requested date (in a macro not a counter) if there was one, otherwise, e.g., if there was no request or a request to a version name it will contain T_EX largest legal number. While loading a file this can be used to provide conditionals that select code based on the request.

```

1487 \ifx\pkgcls@targetdate\@undefined
1488   \newcount\pkgcls@targetdate
1489   \fi
1490 \let\pkgcls@targetlabel\@empty
1491 \def\pkgcls@innerdate{\maxdimen}

```

(End of definition for \pkgcls@targetdate, \pkgcls@targetlabel, and \pkgcls@innerdate.)

\pkgcls@candidate When looping through the **\DeclareRelease** declarations we record if the release is the best candidate we have seen so far. This is recorded in **\pkgcls@candidate** and we update it whenever we see a better one.

In **\pkgcls@releasedate** we keep track of the release date of that candidate.

```

1492 \let\pkgcls@candidate\@empty
1493 \let\pkgcls@releasedate\@empty

```

(End of definition for \pkgcls@candidate and \pkgcls@releasedate.)

\load@onefilewithoptions the best place to add the rollback code is at the point where **\@onefilewithoptions** is called to load a single class or package.

To make things easy we save the old definition as **\load@onefilewithoptions** and then provide a new interface.

Important: as this code is also unconditionally placed into **latexrelease** we can only do this name change once otherwise both macros will contain the same code.

```

1494 \ifx\load@onefilewithoptions\@undefined
1495   \let\load@onefilewithoptions\@onefilewithoptions
1496   \def\@onefilewithoptions#1[#2][#3]#4{%

```

First a bit of tracing normally disabled.

```

1497 <*tracerollback>
1498 \pkgcls@debug{--- File loaded request (\noexpand\usepackage or ...)}%
1499 \pkgcls@debug{\@spaces 1: #1}%
1500 \pkgcls@debug{\@spaces 2: #2}%
1501 \pkgcls@debug{\@spaces 3: #3}%
1502 \pkgcls@debug{\@spaces 4: #4}%
1503 </tracerollback>

```

Two of the arguments are needed later on in error/warning messages so we save them.

```

1504 \def\pkgcls@name{#1}%           % for info message
1505 \def\pkgcls@arg {#3}%          % for info message

```

then we parse the final optional argument to determine if there is a specific rollback request for the current file. This will set `\pkgcls@targetdate`, `\pkgcls@targetlabel` and `\pkgcls@mindate`.

```

1506 \pkgcls@parse@date@arg{#3}%

```

When determining the correct release to load we keep track of candidates in `\pkgcls@candidate` and initially we don't have any:

```

1507 \let\pkgcls@candidate\@empty

```

If we had a rollback request then `#3` may contain data but not necessarily a “minimal date” so instead of passing it on we pass on the content of `\pkgcls@mindate`. We need to pass the value not the command, otherwise nested packages may pick up the wrong information.

```

1508 \begingroup
1509 \edef\reserved@a{%
1510   \endgroup
1511   \unexpanded{\load@onefilewithoptions#1[#2]}%
1512   [\pkgcls@mindate]%
1513   \unexpanded{#4}}%
1514 \reserved@a
1515 }
1516 \fi

```

(End of definition for \load@onefilewithoptions and \@onefilewithoptions.)

`\pkgcls@parse@date@arg` The `\pkgcls@parse@date@arg` command parses the second optional argument of `\usepackage`, `\RequirePackage` or `\documentclass` for a rollback request setting the values of `\pkgcls@targetdate` and `\pkgcls@targetlabel`.

This optional argument has a dual purpose: If it just contains a date string then this means that the package should have at least that date (to ensure that a certain feature is actually available, or a certain bug has been fixed). When the package gets loaded the information in `\Provides...` will then be checked against this request.

But if it starts with an equal sign followed by a date string or followed by a version name then this means that we should roll back to the state of the package at that date or to the version with the requested name.

If there was no optional argument or the optional argument does not start with “=” then the `\pkgcls@targetdate` is set to the date of the overall rollback request (via `latexrelease`) or if that was not given it is set to 0. In either case `\pkgcls@targetlabel` will be made empty.

If the argument doesn't start with “=” then it is supposed to be a “minimal date” and we therefore save the value in `\pkgcls@mindate`, otherwise this macro is made empty.

So in summary we have:

| Input | <code>\pkgcls@targetdate</code> | <code>\pkgcls@targetlabel</code> | <code>\pkgcls@mindate</code> |
|-------------------------------|--|----------------------------------|------------------------------|
| <code><empty></code> | <code>→ <global-rollbackdate-as-number></code> | <code><empty></code> | <code><empty></code> |
| <code><date></code> | <code>→ <global-rollbackdate-as-number></code> | <code><empty></code> | <code><date></code> |
| <code>=<date></code> | <code>→ <date-as-number></code> | <code><empty></code> | <code><empty></code> |
| <code>=<version></code> | <code>→ 1</code> | <code><version></code> | <code><empty></code> |
| <code><other></code> | <code>→ <global-rollbackdate-as-number></code> | <code><empty></code> | <code><other></code> |

where `<global-rollbackdate-as-number>` is a date request given via `latexrelease` or if there wasn't one 0.

```
1517 \def\pkgcls@parse@date@arg #1{%
```

If the argument is empty we use the rollback date from `latexrelease` which has the value of zero if there was no rollback request. The label and the minimal date is made empty in that case.

```
1518 \ifx\@nil#1\@nil
1519 \pkgcls@targetdate\requestedLaTeXdate\relax
1520 \let\pkgcls@targetlabel\@empty
1521 \let\pkgcls@mindate\@empty
```

Otherwise we parse the argument further, checking for a = as the first character. We append a = at the end so that there is at least one such character in the argument.

```
1522 \else
1523 \pkgcls@parse@date@arg@#1=\@nil\relax
1524 \fi
1525 }
```

The actual parsing work then happens in `\pkgcls@parse@date@arg@:`

```
1526 \def\pkgcls@parse@date@arg@#1=#2\@nil{%
```

We set `\pkgcls@targetdate` depending on the parsing result; the code is expandable so we can do the parsing as part of the assignment.

```
1527 \pkgcls@targetdate
```

If a = was in first position then #1 will be empty. In that case #2 will be the original argument with a = appended.

This can be parsed with `\@parse@version`, the trailing character is simply ignored. This macro returns the parsed date as a number (or zero if it wasn't a date) and accepts both YYYY/MM/DD and YYYY-MM-DD formats.

```
1528 \ifx\@nil#1\@nil
1529 \@parse@version0#2//00\@nil\relax
```

Whatever is returned is thus assigned to `\pkgcls@targetdate` and therefore we can now test its value. If the value is zero we assume that the remaining argument string represents a version and change `\pkgcls@targetdate` and set `\pkgcls@targetlabel` to the version name (after stripping off the trailing =.

```
1530 \ifnum \pkgcls@targetdate=\z@
1531 \pkgcls@targetdate\@ne
1532 \def\pkgcls@innerdate{\maxdimen}%
1533 \pkgcls@parse@date@arg@version#2%
1534 \else
1535 \edef\pkgcls@innerdate{\the\pkgcls@targetdate}%
1536 \fi
1537 \let\pkgcls@mindate\@empty
1538 \else
```

If #1 was not empty then there wasn't a = character in first position so we are dealing either with a “minimum date” or with some incorrect data. We assume the former and make the following assignments (the first one finishing the assignment of \pkgcls@targetdate):

```
1539 \requestedLaTeXdate\relax
1540 \let\pkgcls@targetlabel\@empty
1541 \def\pkgcls@innerdate{\maxdimen}%
1542 \def\pkgcls@mindate{#1}%
```

If the min-date is after the requested rollback date (if there is any, i.e., if it is not zero) then we have a conflict and therefore issue a warning.

```
1543 \ifnum \pkgcls@targetdate > \z@
1544 \ifnum \@parse@version0#1//00\@nil > \pkgcls@targetdate
1545 \@latex@warning@no@line{Suspicious rollback/min-date date given\MessageBreak
1546 A minimal date of #1 has been specified for
1547 \@cls@pkg\MessageBreak '\pkgcls@name'.\MessageBreak
1548 But this is in conflict
1549 with a rollback request to \requestedpatchdate}
1550 \fi
1551 \fi
1552 \fi
1553 }
```

Strip off the trailing = and assign the version name to \pkgcls@targetlabel.

```
1554 \def\pkgcls@parse@date@arg@version#1={%
1555 \def\pkgcls@targetlabel{#1}}
```

(End of definition for \pkgcls@parse@date@arg.)

\DeclareRelease First argument is the “name” of the release and it can be left empty if one doesn't like to give a name to the release. The second argument is that from which on this release was available (or should be used in case of minor updates). The final argument is the external file name of this release, by convention this should be $\langle pkg/cls-name \rangle - \langle date \rangle . \langle extension \rangle$ but this is not enforced and through this argument one can overwrite it.

```
1556 \def\DeclareRelease#1#2#3{%
1557 \ifnum\pkgcls@targetdate>\z@ % some sort of rollback request
1558 (*traceroollback)
1559 \pkgcls@debug{---\string\DeclareRelease:}%
1560 \pkgcls@debug{\@spaces 1: #1}%
1561 \pkgcls@debug{\@spaces 2: #2}%
1562 \pkgcls@debug{\@spaces 3: #3}%
1563 /traceroollback}
```

If the date argument #2 is empty we are dealing with a special release that should be only accessible via its name; a typical use case would be a “beta” release. So if we are currently processing a date request we ignore it and otherwise we check if we can match the name and if so load the corresponding release file.

```
1564 \ifx\@nil#2\@nil
1565 \ifnum\pkgcls@targetdate=\@one % named request
1566 \def\reserved@a{#1}%
1567 \ifx\pkgcls@targetlabel\reserved@a
1568 \pkgcls@use@this@release{#3}{}%
1569 (*traceroollback)
1570 \else
```

```

1571         \pkgcls@debug{Label doesn't match}%
1572     </tracerollback>
1573     \fi
1574 < *tracerollback>
1575     \else
1576         \pkgcls@debug{Date request: ignored}%
1577 </tracerollback>
1578     \fi
1579     \else

```

If the value of `\pkgcls@targetdate` is greater than 1 (or in reality greater than something like 19930101) we are dealing with a rollback request to a specific date.

```

1580     \ifnum\pkgcls@targetdate>\@ne % a real request

```

So we parse the date of this release to check if it is before or after the request date.

```

1581         \ifnum\@parse@version#2//00\@nil
1582             >\pkgcls@targetdate

```

If it is after we have to distinguish between two cases: If there was an earlier candidate we use that one because the other is too late, but if there wasn't one (i.e., if current release is the oldest that exists) we use it as the best choice. However in that case something is wrong (as there shouldn't be a rollback to a date where a package used doesn't yet exist). So we make a complaint to the user.

```

1583         \ifx\pkgcls@candidate\@empty
1584             \pkgcls@rollbackdate@error{#2}%
1585             \pkgcls@use@this@release{#3}{#2}%
1586         \else
1587             \pkgcls@use@this@release\pkgcls@candidate
1588                                     \pkgcls@releasedate
1589         \fi
1590     \else

```

Otherwise, if the release date of this version is before the target rollback and we record it as a candidate. But we don't use it yet as there may be another release which is still before the target rollback.

```

1591         \def\pkgcls@candidate{#3}%
1592         \def\pkgcls@releasedate{#2}%
1593 < *tracerollback>
1594         \pkgcls@debug{New candidate: #3}%
1595 </tracerollback>
1596     \fi
1597     \else

```

If we end up in this branch we have a named version request. So we check if `\pkgcls@targetlabel` matches the current name and if yes we use this release immediately, otherwise we do nothing as a later declaration may match it.

```

1598         \def\reserved@a{#1}%
1599         \ifx\pkgcls@targetlabel\reserved@a
1600             \pkgcls@use@this@release{#3}{#2}%
1601 < *tracerollback>
1602         \else

1606     \fi

```

```

1607     \fi
1608   \fi
1609 }

```

(End of definition for \DeclareRelease.)

\pkgcls@use@this@release If a certain release has been selected (stored in the external file given in #1) we need to input it and afterwards stop reading the current file.

```

1610 \def\pkgcls@use@this@release#1#2{%

```

Before that we record the selection made inside the transcript.

```

1611   \pkgcls@show@selection{#1}{#2}%

```

We then set the `\pkgcls@targetdate` to zero so that any `\DeclareRelease` or `\DeclareCurrentRelease` in the file we now load are bypassed⁴⁵ and then we finally load the correct release.

After loading that file we need to stop reading the current file so we issue `\endinput`. Note that the `\relax` before that is essential to ensure that the `\endinput` is only happening after the file has been fully processed, otherwise it would act after the first line of the `@@input`!

```

1612     \pkgcls@targetdate\z@
1613     @@input #1\relax
1614     \endinput
1615 }

```

(End of definition for \pkgcls@use@this@release.)

\pkgcls@show@selection This command records what selection was made. As that is needed in two places (and it is rather lengthy) it was placed in a separate command. The first argument is the name of the external file that is being loaded and is only needed for debugging. The second argument is the date that corresponds to this file and it is used as part of the message.

```

1616 \def\pkgcls@show@selection#1#2{%
1617   (*traceroollback)
1618   \pkgcls@debug{Result: use #1}%
1619   (/traceroollback)
1620   \GenericInfo
1621   {\@spaces\@spaces\space}{Rollback for
1622     \@cls@pkg\space'\@currname' requested ->
1623     \ifnum\pkgcls@targetdate>\@ne
1624       date
1625       \ifnum\requestedLaTeXdate=\pkgcls@targetdate
1626         \requestedpatchdate
1627       \else
1628         \expandafter\@gobble\pkgcls@arg
1629       \fi.\MessageBreak

```

Instead of “best approximation” we could say that we have been able to exactly match the date (if it is exact), but that would mean extra tests without much gain, so not done.

```

1630       Best approximation is
1631     \else
1632       version '\pkgcls@targetlabel' .\MessageBreak

```

⁴⁵The older release may also have such declarations inside if it was a simply copy of the `.sty` or `.cls` file current at that date. Removing these declarations would make the file load a tiny bit faster, but this way it works in any case.

```

1633         This corresponds to
1634     \fi
1635     \ifx\@nil#2\@nil
1636         a special release%
1637     \else
1638         the release introduced on #2%
1639     \fi
1640     \@gobble}%
1641 }

```

(End of definition for `\pkgcls@show@selection`.)

`\pkgcls@rollbackdate@error` This is called if the requested rollback date is earlier than the earliest known release of a package or class.

A similar error is given if global rollback date and min-date on a specific package conflict with each other, but that case is happens only once so it is inlined.

```

1642 \def\pkgcls@rollbackdate@error#1{%
1643     \@latex@error{Suspicious rollback date given}%
1644     {The \cls@pkg\space'\@currname' has no rollback data
1645     before #1 which\MessageBreak
1646     is after your requested rollback date --- so
1647     something may be wrong here.\MessageBreak
1648     Continue and we use the earliest known release.}}

```

(End of definition for `\pkgcls@rollbackdate@error`.)

`\DeclareCurrentRelease` This declares the date (and possible name) of the current version of a package or class.

```

1649 \def\DeclareCurrentRelease#1#2{%
First we test if \pkgcls@targetdate is greater than zero, otherwise this code is bypassed
(as there is no rollback request).
1650     \ifnum\pkgcls@targetdate>\z@ % some sort of rollback request
1651     \tracereollback
1652     \pkgcls@debug{---DeclareCurrentRelease}%
1653     \pkgcls@debug{ 1: #1}%
1654     \pkgcls@debug{ 2: #2}%
1655     \tracereollback

```

If the value is greater than 1 we have to deal with a date request, so we parse #2 as a date and compare it with `\pkgcls@targetdate`.

```

1656     \ifnum\pkgcls@targetdate>\@ne % a date request
1657     \ifnum\@parse@version#2//00\@nil
1658         >\pkgcls@targetdate

```

If it is greater that means the release date if this file is later than the requested rollback date. Again we have two cases: If there was a previous candidate release we use that one as the current release is too young, but if there wasn't we have to use this release nevertheless as there isn't any alternative.

However this case can only happen if there is a `\DeclareCurrentRelease` but no declared older releases (so basically the use of the declaration is a bit dubious).

```

1659     \ifx\pkgcls@candidate\@empty
1660     \pkgcls@rollbackdate@error{#2}%
1661     \else
1662     \pkgcls@use@this@release\pkgcls@candidate
1663     \pkgcls@releasedate
1664     \fi

```

Otherwise the current file is the right release, so we record that in the transcript and then carry on.

```

1665     \else
1666         \pkgcls@show@selection{current version}{#2}%
1667     \fi
1668     \else % a label request

```

Otherwise we have a rollback request to a named version so we check if that fits the current name and if not give an error as this was the last possible opportunity.

```

1669     \def\reserved@a{#1}%
1670     \ifx\pkgcls@targetlabel\reserved@a
1671         \pkgcls@show@selection{current version}{#2}%
1672     \else
1673         \@latex@error{Requested version '\pkgcls@targetlabel' for
1674             \cls@pkg\space'\@currname' is unknown}\@ehc
1675     \fi
1676 \fi
1677 \fi
1678 }

```

(End of definition for \DeclareCurrentRelease.)

\IfTargetDateBefore This enables a simple form of conditional code inside a class or package file. If there is a date request and the request date is earlier than the first argument the code in the second argument is processed otherwise the code in the third argument is processed. If there was no date request then we also execute the third argument, i.e., we will get the “latest” version of the file.

Most often the second argument (before-date-code) will be empty.

```

1679 \DeclareRobustCommand\IfTargetDateBefore[1]{%
1680     \ifnum\pkgcls@innerdate <%
1681         \expandafter\@parse@version\expandafter0#1//00\@nil
1682         \typeout{Exclude code introduced on #1}%
1683         \expandafter\@firstoftwo
1684     \else
1685         \typeout{Include code introduced on #1}%
1686         \expandafter\@secondoftwo
1687     \fi
1688 }

```

(End of definition for \IfTargetDateBefore.)

```

1689 </2ekernel | latexreleasefirst>

```

6 After Preamble

Finally we declare a package that allows all the commands declared above to be `\onlypreamble` to be used after `\begin{document}`.

```

1690 <*afterpreamble>
1691 \NeedsTeXFormat{LaTeX2e}
1692 \ProvidesPackage{pkgindoc}
1693     [2020-08-08 v1.3m Package Interface in Document (DPC)]
1694 \def\reserved@a#1\do\@classoptionslist#2\do\filecontents#3\relax{%
1695     \gdef\@preamblecmds{#1#3}}

```

```
1696 \expandafter\reserved@a\@preamblecmds\relax
1697 \afterpreamble>
```

File X

ltkeys.dtx

1 Creating and using keyval options

As with any key–value input, using key–value pairs as package or class options has two parts: creating the key options and setting (using) them. Options created in this way *may* be used after package loading as general key–value settings: this will depend on the nature of the underlying code.

`\DeclareKeys` `\DeclareKeys [<family>] {<declarations>}`

Creates a series of options from a comma-separated *<declarations>* list. Each entry in this list is a key–value pair, with the *<key>* having one or more *<properties>*. A small number of “basic” *<properties>* are described below. The full range of properties, provided by `l3keys`, can also be used for more powerful processing. See `interface3` for the full details.

The basic properties provided here are

- `.code` — execute arbitrary code
- `.if` — sets a TeX `\if...` switch
- `.ifnot` — sets an inverted TeX `\if...` switch
- `.store` — stores a value in a macro
- `.usage` — defines whether the option can be given only when loading (`load`), in the preamble (`preamble`) or has no limitation on scope (`general`)

The part of the *<key>* before the *<property>* is the *<name>*, with the *<value>* working with the *<property>* to define the behaviour of the option.

For example, with

```
\DeclareKeys[mypkg]
{
  draft.if          = @mypkg@draft      ,
  draft.usage       = preamble          ,
  name.store        = \@mypkg@name      ,
  name.usage        = load              ,
  second-name.store = \@mypkg@other@name
}
```

three options would be create. The option `draft` can be given anywhere in the preamble, and will set a switch called `\if@mypkg@draft`. The option `name` can only be given during package loading, and will save whatever value it is given in `\@mypkg@name`. Finally, the option `second-name` can be given anywhere, and will save its value in `\@mypkg@other@name`.

Keys created *before* the use of `\ProcessKeyOptions` act as package options.

| | |
|--|---|
| <hr/> <code>\DeclareUnknownKeyHandler</code> <hr/> | <code>\DeclareUnknownKeyHandler [⟨family⟩] {⟨code⟩}</code> The function <code>\DeclareUnknownKeyHandler</code> may be used to define the behavior when an undefined key is encountered. The <code>⟨code⟩</code> will receive the unknown key name as <code>#1</code> and the value as <code>#2</code> . These can then be processed as appropriate, e.g. by forwarding to another package. |
| <hr/> <code>\ProcessKeyOptions</code> <hr/> | <code>\ProcessKeyOptions [⟨family⟩]</code> The <code>\ProcessKeyOptions</code> function is used to check the current option list against the keys defined for <code>⟨family⟩</code> . Global (class) options and local (package) options are checked when this function is called in a package. |
| <hr/> <code>\SetKeys</code> <hr/> | <code>\SetKeys [⟨family⟩] {⟨keyvals⟩}</code> Sets (applies) the explicit list of <code>⟨keyvals⟩</code> for the <code>⟨family⟩</code> : if the latter is not given, the value of <code>\@currname</code> is used. This command may be used within a package to set options before or after using <code>\ProcessKeyOptions</code> . |

1.1 Implementation of `ltkeys`

```

1 <@@=keys>
2 <*2kernel>
3 \ExplSyntaxOn

```

1.2 Key properties

```

.code
.if      4 \group_begin:

(End of definition for .code and others.)

1.3 Main mechanism

```

22 \cs_generate_variant:Nn \clist_put_right:Nn { Nv }
\l__keys_options_clist A single list is used for all options, into which they are collected before processing.
23 \clist_new:N \l__keys_options_clist

```

(End of definition for \l_keys_options_clist.)

\l_keys_options_loading_bool

Used to indicate we are in the loading phase: controls the outcome of warnings.

```
24 \bool_new:N \l_keys_options_loading_bool
```

```
\__keys_options:n
\__keys_options_aux:n
\__keys_options_end:
```

The main function calls functions to collect up the global and local options into \l_keys_options_clist before calling the underlying functions to actually do the processing. So that a suitable message is produced if the option is unknown, the special `unknown` key is set if it does not already exist for the current family, and is cleaned up afterwards if required. To allow the L^AT_EX 2_ε layer to know this mechanism is active, and to deal with the key family not matching the file name, we store the family in all cases.

```
25 \cs_new_protected:Npn \__keys_options:n #1

61 }
```

(End of definition for __keys_options:n, __keys_options_aux:n, and __keys_options_end:.)

`__keys_options_global:n` Global (class) options are handled differently for L^AT_EX 2_ε packages and classes. Hence this function is essentially a check on the current file type. The initial test is needed as L^AT_EX 2_ε allows variables to be equal to `\scan_stop:`, which is usually forbidden in expl3 code.

```

62 \cs_new_protected:Npn \__keys_options_global:n #1
63 {
64   \cs_if_eq:NNF \@raw@classoptionslist \scan_stop:
65   {
66     \cs_if_eq:NNTF \@currentt \cclsextension
67     { \__keys_options_class:n {#1} }
68     { \__keys_options_package:n {#1} }
69   }
70 }

```

(End of definition for `__keys_options_global:n`.)

`__keys_options_class:n` For classes, each option (stripped of any content after =) is checked for existence as a key. If found, the option is added to the combined list for processing. On the other hand, unused options are stored up in `\@unusedoptionlist`. Before any of that, though, there is a simple check to see if there is an unknown key. If there is, then *everything* will match and the mapping can be skipped.

`__keys_options_class:nnn`

```

71 \cs_new_protected:Npn \__keys_options_class:n #1
72 {
73   \cs_if_free:cF { \@raw@opt@ \@currname . \@currentt }
74   {
75     \keys_if_exist:nnTF {#1} { unknown }
76     {
77       \clist_put_right:Nv \l__keys_options_clist
78       { \@raw@opt@ \@currname . \@currentt }
79     }
80     {
81       \clist_map_inline:cn { \@raw@opt@ \@currname . \@currentt }
82       {
83         \exp_args:Ne \__keys_options_class:nnn
84         { \__keys_remove_equals:n {##1} }
85         {##1} {#1}
86       }
87     }
88   }
89 }
90 \cs_new_protected:Npn \__keys_options_class:nnn #1#2#3
91 {
92   \keys_if_exist:nnTF {#3} {#1}
93   {
94     \clist_put_right:Nn \l__keys_options_clist {#2}
95     \clist_remove_all:Nn \@unusedoptionlist {#1}
96   }
97   {
98     \clist_if_in:NnF \@unusedoptionlist {#1}
99     { \clist_put_right:Nn \@unusedoptionlist {#1} }
100   }
101 }

```

(End of definition for `__keys_options_class:n` and `__keys_options_class:nnn`.)

`__keys_options_package:n`
`__keys_options_package:nnn`

For global options when processing a package, the tasks are slightly different from those for a class. The check is the same, but here there is nothing to do if the option is not applicable. Each valid option also needs to be removed from `\@unusedoptionlist`.

```

102 \cs_new_protected:Npn \__keys_options_package:n #1
103 {
104   \clist_map_inline:Nn \@raw@classoptionslist
105   {
106     \exp_args:Ne \__keys_options_package:nnn
107     { \__keys_remove_equals:n {##1} }
108     {##1} {#1}
109   }
110 }
111 \cs_new_protected:Npn \__keys_options_package:nnn #1#2#3
112 {
113   \keys_if_exist:nnT {#3} {#1}
114   {
115     \clist_put_right:Nn \l__keys_options_clist {#2}
116     \clist_remove_all:Nn \@unusedoptionlist {#1}
117   }
118 }

```

(End of definition for `__keys_options_package:n` and `__keys_options_package:nnn`.)

`__keys_options_local:`

If local options are found, they are added to the processing list. L^AT_EX 2_ε stores options for each file in a macro which may or may not exist, hence the need to use `\cs_if_exist:c`.

```

119 \cs_new_protected:Npn \__keys_options_local:
120 {
121   \cs_if_eq:NnF \@currentx \@clsextension
122   {
123     \cs_if_exist:cT { \@raw@opt@ \@currname . \@currentx }
124     {
125       \clist_put_right:Nv \l__keys_options_clist
126       { \@raw@opt@ \@currname . \@currentx }
127     }
128   }
129 }

```

(End of definition for `__keys_options_local:`.)

`__keys_remove_equals:n`
`__keys_remove_equals:w`

As the name suggests, this is a simple function to remove an equals sign from the input. This is all wrapped up in an `n` function so that there will always be a sign available.

```

130 \cs_new:Npn \__keys_remove_equals:n #1
131 { \__keys_remove_equals:w #1 = \s__keys_stop }
132 \cs_new:Npn \__keys_remove_equals:w #1 = #2 \s__keys_stop { \exp_not:n {#1} }

```

(End of definition for `__keys_remove_equals:n` and `__keys_remove_equals:w`.)

1.4 The document interfaces

```

133 \cs_generate_variant:Nn \keys_define:nn { nx }

```

`__keys_options_expand_module:Nn`
`__keys_options_expand_module:nN`

To deal with active characters inside the module argument whilst also expanding that argument, we use a combination of `c`- and `f`-type expansion. This works as the definitions for active UTF-8 bytes contain an `\ifincsname` test.

```

134 \cs_new_protected:Npn \__keys_options_expand_module:Nn #1#2
135 {
136   \cs:w \__keys_options_expand_module:nN \use:e { \cs_end: {#2} } #1
137 }
138 \cs_new_protected:Npn \__keys_options_expand_module:nN #1#2
139 { #2 {#1} }

(End of definition for \__keys_options_expand_module:Nn and \__keys_options_expand_module:nN.)

```

\DeclareKeys Defining key options is quite straight-forward: we have an intermediate function to allow for potential set-up steps.

```

140 \NewDocumentCommand \DeclareKeys { 0 { \@currname } +m }
141 { \__keys_options_expand_module:Nn \keys_define:nn {#1} {#2} }

(End of definition for \DeclareKeys. This function is documented on page 956.)

```

\DeclareUnknownKeyHandler

```

142 \NewDocumentCommand \DeclareUnknownKeyHandler { 0 { \@currname } +m }
143 {
144   \cs_set_protected:cpn { \__keys_unknown_handler_ #1 :nn } ##1##2 {#2}
145   \__keys_options_expand_module:Nn \keys_define:nx {#1}
146   {
147     unknown .code:n =
148       \exp_not:N \exp_args:NV
149       \exp_not:c { \__keys_unknown_handler_ #1 :nn }
150       \exp_not:N \l_keys_key_str {###1}
151   }
152 }

(End of definition for \DeclareUnknownKeyHandler. This function is documented on page 957.)

```

\ProcessKeyOptions We need to deal with the older interface from l3keys2e here: it had a mandatory argument. We can mop that up using a look-ahead, and then exploit that information to determine whether the package option handling is set up for the new approach for clash handling.

```

153 \NewDocumentCommand \ProcessKeyOptions { 0 { \@currname } }
154 { \__keys_options:n {#1} }
155 \@onlypreamble \ProcessKeyOptions

File Y

ltfilehook.dtx

1 Introduction

1.1 Provided hooks

The code offers a number of hooks into which packages (or the user) can add code to support different use cases. Many hooks are offered as pairs (i.e., the second hook is reversed). Also important to know is that these pairs are properly nested with respect to other pairs of hooks.

There are hooks that are executed for all files of a certain type (if they contain code), e.g., for all “include files” or all “packages”, and there are also hooks that are specific to a single file, e.g., do something after the package `foo.sty` has been loaded.

1.2 General hooks for file reading

There are four hooks that are called for each file that is read using document-level commands such as `\input`, `\include`, `\usepackage`, etc. They are not called for files read using internal low-level methods, such as `\@input` or `\openin`.

| | |
|------------------------------|------------|
| <code>file/before</code> | These are: |
| <code>file/.../before</code> | |
| <code>file/.../after</code> | |
| <code>file/after</code> | |

file/before, file/⟨file-name⟩/before These hooks are executed in that order just before the file is loaded for reading. The code of the first hook is used with every file, while the second is executed only for the file with matching *⟨file-name⟩* allowing you to specify code that only applies to one file.

file/⟨file-name⟩/after, file/after These hooks are after the file with name *⟨file-name⟩* has been fully consumed. The order is swapped (the specific one comes first) so that the `/before` and `/after` hooks nest properly, which is important if any of them involve grouping (e.g., contain environments, for example). Furthermore both hooks are reversed hooks to support correct nesting of different packages adding code to both `/before` and `/after` hooks.

So the overall sequence of hook processing for any file read through the user interface commands of L^AT_EX is:

```
\UseHook{⟨file/before⟩}
\UseHook{⟨file/⟨file name⟩/before⟩}
  ⟨file contents⟩
\UseHook{⟨file/⟨file name⟩/after⟩}
\UseHook{⟨file/after⟩}
```

The file hooks only refer to the file by its name and extension, so the *⟨file name⟩* should be the file name as it is on the filesystem with extension (if any) and without paths. Different from `\input` and similar commands, the `.tex` extension is not assumed in hook *⟨file name⟩*, so `.tex` files must be specified with their extension to be recognized. Files within subfolders should also be addressed by their name and extension only.

Extensionless files also work, and should then be given without extension. Note however that \TeX prioritizes `.tex` files, so if two files `foo` and `foo.tex` exist in the search path, only the latter will be seen.

When a file is input, the $\langle file\ name \rangle$ is available in `\CurrentFile`, which is then used when accessing the `file/\langle file\ name \rangle/before` and `file/\langle file\ name \rangle/after`.

| | |
|---------------------------|--|
| <code>\CurrentFile</code> | The name of the file about to be read (or just finished) is available to the hooks through <code>\CurrentFile</code> (there is no <code>expl3</code> name for it for now). The file is always provided with its extension, i.e., how it appears on your hard drive, but without any specified path to it. For example, <code>\input{sample}</code> and <code>\input{app/sample.tex}</code> would both have <code>\CurrentFile</code> being <code>sample.tex</code> . |
|---------------------------|--|

| | |
|-------------------------------|---|
| <code>\CurrentFilePath</code> | The path to the current file (complement to <code>\CurrentFile</code>) is available in <code>\CurrentFilePath</code> if needed. The paths returned in <code>\CurrentFilePath</code> are only user paths, given through <code>\input@path</code> (or <code>expl3</code> 's equivalent <code>\l_file_search_path_seq</code>) or by directly typing in the path in the <code>\input</code> command or equivalent. Files located by <code>kpsewhich</code> get the path added internally by the \TeX implementation, so at the macro level it looks as if the file were in the current folder, so the path in <code>\CurrentFilePath</code> is empty in these cases (package and class files, mostly). |
|-------------------------------|---|

| | |
|--|--|
| <code>\CurrentFileUsed</code> <code>\CurrentFilePathUsed</code> | In normal circumstances these are identical to <code>\CurrentFile</code> and <code>\CurrentFilePath</code> . They will differ when a file substitution has occurred for <code>\CurrentFile</code> . In that case, <code>\CurrentFileUsed</code> and <code>\CurrentFilePathUsed</code> will hold the actual file name and path loaded by \LaTeX , while <code>\CurrentFile</code> and <code>\CurrentFilePath</code> will hold the names that were <i>asked for</i> . Unless doing very specific work on the file being read, <code>\CurrentFile</code> and <code>\CurrentFilePath</code> should be enough. |
|--|--|

1.3 Hooks for package and class files

Commands to load package and class files (e.g., `\usepackage`, `\RequirePackage`, `\LoadPackageWithOptions`, etc.) offer the hooks from section 1.2 when they are used to load a package or class file, e.g., `file/array.sty/after` would be called after the `array` package got loaded. But as packages and classes form as special group of files, there are some additional hooks available that only apply when a package or class is loaded.

| | |
|---------------------------------|---|
| <code>package/before</code> | These are: |
| <code>package/after</code> | |
| <code>package/.../before</code> | <code>package/before</code>, <code>package/after</code> These hooks are called for each package being loaded. |
| <code>package/.../after</code> | |
| <code>class/before</code> | <code>package/\langle name \rangle/before</code>, <code>package/\langle name \rangle/after</code> These hooks are additionally called if |
| <code>class/after</code> | the package name is $\langle name \rangle$ (without extension). |
| <code>class/.../before</code> | <code>class/before</code>, <code>class/after</code> These hooks are called for each class being loaded. |
| <code>class/.../after</code> | |
| | <code>class/\langle name \rangle/before</code>, <code>class/\langle name \rangle/after</code> These hooks are additionally called if the |
| | class name is $\langle name \rangle$ (without extension). |

All `/after` hooks are implemented as reversed hooks.
The overall sequence of execution for `\usepackage` and friends is therefore:

```

\UseHook{<package/before>}
\UseHook{<package/<package name>/before>}

\UseHook{<file/before>}
\UseHook{<file/<package name>.sty/before>}
<package contents>
\UseHook{<file/<package name>.sty/after>}
\UseHook{<file/after>}

code from \AtEndOfPackage if used inside the package

\UseHook{<package/<package name>/after>}
\UseHook{<package/after>}

```

and similar for class file loading, except that `package/` is replaced by `class/` and `\AtEndOfPackage` by `\AtEndOfClass`.

If a package or class is not loaded (or it was loaded before the hooks were set) none of the hooks are executed!

All class or package hooks involving the name of the class or package are implemented as one-time hooks, whereas all other such hooks are normal hooks. This allows for the following use case

```

\AddToHook{package/varioref/after}
{ ... apply my customizations if the package gets
  loaded (or was loaded already) ... }

```

without the need to first test if the package is already loaded.

1.4 Hooks for `\include` files

To manage `\include` files, \LaTeX issues a `\clearpage` before and after loading such a file. Depending on the use case one may want to execute code before or after these `\clearpages` especially for the one that is issued at the end.

Executing code before the final `\clearpage`, means that the code is processed while the last page of the included material is still under construction. Executing code after it means that all floats from inside the include file are placed (which might have added further pages) and the final page has finished.

Because of these different scenarios we offer hooks in three places.⁴⁶ None of the hooks are executed when an `\include` file is bypassed because of an `\includeonly` declaration. They are, however, all executed if \LaTeX makes an attempt to load the `\include` file (even if it doesn't exist and all that happens is “No file `<filename>.tex`”).

⁴⁶If you want to execute code before the first `\clearpage` there is no need to use a hook—you can write it directly in front of the `\include`.

| | |
|---------------------------------|--|
| <code>include/before</code> | These are: |
| <code>include/.../before</code> | |
| <code>include/end</code> | <code>include/before</code>, <code>include/⟨name⟩/before</code> These hooks are executed (in that order) after the initial <code>\clearpage</code> and after <code>.aux</code> file is changed to use <code>⟨name⟩.aux</code> , but |
| <code>include/.../end</code> | before the <code>⟨name⟩.tex</code> file is loaded. In other words they are executed at the very |
| <code>include/after</code> | beginning of the first page of the <code>\include</code> file. |
| <code>include/.../after</code> | |

`include/⟨name⟩/end`, `include/end` These hooks are executed (in that order) after `LaTeX` has stopped reading from the `\include` file, but before it has issued a `\clearpage` to output any deferred floats.

`include/⟨name⟩/after`, `include/after` These hooks are executed (in that order) after `LaTeX` has issued the `\clearpage` but before it has switched back writing to the main `.aux` file. Thus technically we are still inside the `\include` and if the hooks generate any further typeset material including anything that writes to the `.aux` file, then it would be considered part of the included material and bypassed if it is not loaded because of some `\includeonly` statement.⁴⁷

`include/excluded`, `include/⟨name⟩/excluded` The above hooks for `\include` files are only executed when the file is loaded (or more exactly the load is attempted). If, however, the `\include` file is explicitly excluded (through an `\includeonly` statement) the above hooks are bypassed and instead the `include/excluded` hook followed by the `include/⟨name⟩/excluded` hook are executed. This happens after `LaTeX` has loaded the `.aux` file for this include file, i.e., after `LaTeX` has updated its counters to pretend that the file was seen.

All `include` hooks involving the name of the included file are implemented as one-time hooks (whereas all other such hooks are normal hooks).

If you want to execute code that is run for every `\include` regardless of whether or not it is excluded, use the `cmd/include/before` or `cmd/include/after` hooks.

1.5 High-level interfaces for `LaTeX`

We do not provide any additional wrappers around the hooks (like `filehook` or `scrfile` do) because we believe that for package writers the high-level commands from the hook management, e.g., `\AddToHook`, etc. are sufficient and in fact easier to work with, given that the hooks have consistent naming conventions.

⁴⁷For that reason another `\clearpage` is executed after these hooks which normally does nothing, but starts a new page if further material got added this way.

1.6 Internal interfaces for L^AT_EX

| | | |
|---|---|--|
| <code>\declare@file@substitution</code> | <code>\declare@file@substitution</code> | <code>{\file}} {\replacement-file}}</code> |
| <code>\undeclare@file@substitution</code> | <code>\undeclare@file@substitution</code> | <code>{\file}}</code> |

If `\file` is requested for loading replace it with `\replacement-file`. `\CurrentFile` remains pointing to `\file` but `\CurrentFileUsed` will show the file actually loaded.

The main use case for this declaration is to provide a corrected version of a package that can't be changed (due to its license) but no longer functions because of L^AT_EX kernel changes, for example, or to provide a version that makes use of new kernel functionality while the original package remains available for use with older releases.

The `\undeclare@file@substitution` declaration undoes a substitution made earlier.

Please do not misuse this functionality and replace a file with another unless if really needed and only if the new version is implementing the same functionality as the original one!

| | | |
|-------------------------------------|-------------------------------------|---|
| <code>\disable@package@load</code> | <code>\disable@package@load</code> | <code>{\package}} {\alternate-code}}</code> |
| <code>\reenable@package@load</code> | <code>\reenable@package@load</code> | <code>{\package}}</code> |

If `\package` is requested do not load it but instead run `\alternate-code` which could issue a warning, error or any other code.

The main use case is for classes that want to restrict the set of supported packages or contain code that make the use of some packages impossible. So rather than waiting until the document breaks they can set up informative messages why certain packages are not available.

The function is only implemented for packages not for arbitrary files.

1.7 A sample package for structuring the log output

As an application we provide the package `structuredlog` that adds lines to the `.log` when a file is opened and closed for reading keeping track of nesting level as well. For example, for the current document it adds the lines

```
= (LEVEL 1 START) t1lmr.fd
= (LEVEL 1 STOP) t1lmr.fd
= (LEVEL 1 START) supp-pdf.mkii
= (LEVEL 1 STOP) supp-pdf.mkii
= (LEVEL 1 START) nameref.sty
== (LEVEL 2 START) refcount.sty
== (LEVEL 2 STOP) refcount.sty
== (LEVEL 2 START) gettitlestring.sty
== (LEVEL 2 STOP) gettitlestring.sty
= (LEVEL 1 STOP) nameref.sty
= (LEVEL 1 START) ltfilehook-doc.out
= (LEVEL 1 STOP) ltfilehook-doc.out
= (LEVEL 1 START) ltfilehook-doc.out
= (LEVEL 1 STOP) ltfilehook-doc.out
= (LEVEL 1 START) ltfilehook-doc.hd
```

```

= (LEVEL 1 STOP) ltfilehook-doc.hd
= (LEVEL 1 START) ltfilehook.dtx
== (LEVEL 2 START) ot1lmr.fd
== (LEVEL 2 STOP) ot1lmr.fd
== (LEVEL 2 START) om1lmm.fd
== (LEVEL 2 STOP) om1lmm.fd
== (LEVEL 2 START) omslmsy.fd
== (LEVEL 2 STOP) omslmsy.fd
== (LEVEL 2 START) omxlmex.fd
== (LEVEL 2 STOP) omxlmex.fd
== (LEVEL 2 START) umsa.fd
== (LEVEL 2 STOP) umsa.fd
== (LEVEL 2 START) umsb.fd
== (LEVEL 2 STOP) umsb.fd
== (LEVEL 2 START) ts1lmr.fd
== (LEVEL 2 STOP) ts1lmr.fd
== (LEVEL 2 START) t1lmss.fd
== (LEVEL 2 STOP) t1lmss.fd
= (LEVEL 1 STOP) ltfilehook.dtx

```

Thus if you inspect an issue in the .log it is easy to figure out in which file it occurred, simply by searching back for LEVEL and if it is a STOP then remove 1 from the level value and search further for LEVEL with that value which should then be the START level of the file you are in.

2 The Implementation

```

1 < *2ekernel >
2 < @@=filehook >

```

2.1 Document and package-level commands

\CurrentFile User-level macros that hold the current file name and file path. These are used internally as well because the code takes care to protect against a possible redefinition of these macros in the loaded file (it's necessary anyway to make hooks work with nested \input).

\CurrentFilePath The versions \...Used hold the *actual* file name and path that is loaded by L^AT_EX, whereas the other two hold the name as requested. They will differ in case there's a file substitution.

\CurrentFileUsed

\CurrentFilePathUsed

```

3 < /2ekernel >

21 <latexrelease>\let \CurrentFilePathUsed \@undefined
22 <latexrelease>
23 <latexrelease>\EndIncludeInRelease
24 <*2ekernel>

```

(End of definition for `\CurrentFile` and others. These functions are documented on page 965.)

2.2 expl3 helpers

```

25 </2ekernel>
26 <*2ekernel | latexrelease>
27 <latexrelease>\IncludeInRelease{2020/10/01}%
28 <latexrelease>          {\_filehook_file_parse_full_name:nN}{File helpers}%
29 \ExplSyntaxOn

```

`_filehook_file_parse_full_name:nN`
`_filehook_full_name:nn`

A utility macro to trigger expl3's file-parsing and lookup, and return a normalized representation of the file name. If the queried file doesn't exist, no normalization takes place. The output of `_filehook_file_parse_full_name:nN` is passed on to the #2—a 3-argument macro that takes the *<path>*, *<base>*, and *<ext>* parts of the file name.

```

30 \cs_new:Npn \_filehook_file_parse_full_name:nN #1
31 {
32   \exp_args:Nf \file_parse_full_name_apply:nN
33   {
34     \exp_args:Nf \_filehook_full_name:nn
35     { \file_full_name:n {#1} } {#1}
36   }
37 }
38 \cs_new:Npn \_filehook_full_name:nn #1 #2
39 {
40   \tl_if_empty:nTF {#1}
41   { \tl_trim_spaces:n {#2} }
42   { \tl_trim_spaces:n {#1} }
43 }

```

(End of definition for `_filehook_file_parse_full_name:nN` and `_filehook_full_name:nn`.)

`_filehook_if_no_extension:nTF`
`_filehook_drop_extension:N`

Some actions depend on whether the file extension was explicitly given, and sometimes the extension has to be removed. The macros below use `_filehook_file_parse_full_name:nN` to split up the file name and either check if *<ext>* (#3) is empty, or discard it.

```

44 \cs_new:Npn \_filehook_if_no_extension:nTF #1
45 {
46   \exp_args:Ne \tl_if_empty:nTF
47   { \file_parse_full_name_apply:nN {#1} \use_iii:nnn }
48 }
49 \cs_new_protected:Npn \_filehook_drop_extension:N #1
50 {
51   \tl_gset:Nx #1

```

```

52     {
53       \exp_args:NV \__filehook_file_parse_full_name:nN #1
54       \__filehook_drop_extension_aux:nnn
55     }
56   }
57 \cs_new:Npn \__filehook_drop_extension_aux:nnn #1 #2 #3
58   { \tl_if_empty:nF {#1} { #1 / } #2 }

```

(End of definition for __filehook_if_no_extension:nTF and __filehook_drop_extension:N.)

\g__filehook_input_file_seq Yet another stack, to keep track of \CurrentFile and \CurrentFilePath with nested \l__filehook_internal_tl \inputs. At the beginning of \InputIfFileExists, the current value of \CurrentFilePath and \CurrentFile is pushed to \g__filehook_input_file_seq, and at the end, it is popped and the value reassigned. Some other places don't use \InputIfFileExists directly (\include) or need \CurrentFile earlier (\@onefilewithoptions), so these are manually used elsewhere as well.

```

59 \tl_new:N \l__filehook_internal_tl

2.3 Declaring the file-related hooks

These hooks have names with three-parts that start with `file/`, `include/`, `class/` or `package/` and end with `/before` or `/after` (or `/end` in the case of `include/`). They are all generic hooks so will be declared only if code is added to them; this declaration is done for you automatically and, indeed, they should not be declared explicitly.

Those named `.../after` and `include/.../end` are, when code is added, declared as reversed hooks.

2.4 Patching L^AT_EX’s `\InputIfFileExists` command

Most of what we have to do is adding `\UseHook` into several L^AT_EX 2_ε core commands, because of some circular dependencies in the kernel we do this only now and not in `ltxfiles`.

`\InputIfFileExists` `\InputIfFileExists` loads any file if it is available so we have to add the hooks `file/before` and `file/after` in the right places. If the file doesn’t exist no hooks should be executed.

```

143 </2ekernel>
144 <latexrelease>\IncludeInRelease{2020/10/01}%
145 <latexrelease>          {\InputIfFileExists}{Hook management (files)}%
146 <*2ekernel | latexrelease>

147 \let\InputIfFileExists\@undefined
148 \DeclareRobustCommand \InputIfFileExists[2]{%
149   \IfFileExists{#1}%
150   {%
151     \@expl@@@filehook@file@push@@
152     \@filehook@set@CurrentFile

```

We pre-expand `\@filef@und` so that in case another file is loaded in the true branch of `\InputIfFileExists`, these don’t change their value meanwhile. This isn’t a worry with `\CurrentFile...` because they are kept in a stack.

```

153   \expandafter\@swaptwoargs\expandafter
154   {\expandafter\@input@file@exists@with@hooks
155     \expandafter{\@filef@und}}%
156   {#2}%
157   \@expl@@@filehook@file@pop@@
158   }%
159 }
160 \def\@input@file@exists@with@hooks#1{%

```

If the file exists then `\CurrentFile` holds its name. But we can’t rely on that still being true after the file has been processed. Thus for using the name in the file hooks we need to preserve the name and then restore it for the `file/.../after` hook.

The hook always refers to the file requested by the user. The hook is *always* loaded for `\CurrentFile` which usually is the same as `\CurrentFileUsed`. In the case of a file replacement, the `\CurrentFileUsed` holds the actual file loaded. In any case the file names are normalized so that the hooks work on the real file name, rather than what the user typed in.

`expl3`’s `\file_full_name:n` normalizes the file name (to factor out differences in the `.tex` extension), and then does a file lookup to take into account a possible path from `\l_file_search_path_seq` and `\input@path`. However only the file name and extension

are returned so that file hooks can refer to the file by their name only. The path to the file is returned in `\CurrentFilePath`.

```

161 \edef\reserved@a{%
162   \@expl@@@filehook@file@pop@assign@@nnnn
163   {\CurrentFilePathUsed}%
164   {\CurrentFileUsed}%
165   {\CurrentFilePath}%
166   {\CurrentFile}}%
167 \expandafter\@swaptwoargs\expandafter{\reserved@a}%

```

Before adding to the file list we need to make all (letter) characters catcode 11, because several packages use constructions like

```

\filename@parse{<filename>}
\ifx\filename@ext\@clsextension
...
\fi

```

and that doesn't work if `\filename@ext` is `\detokenized`. Making `\@clsextension` a string doesn't help much because some packages define their own `\<prefix>@someextension` with normal catcodes. This is not entirely correct because packages loaded (somehow) with catcode 12 alphabetic tokens (say, as the result of a `\string` or `\detokenize` command, or from a T_EX string like `\jobname`) will have these character tokens incorrectly turned into letter tokens. This however is rare, so we'll go for the all-letters approach (grepping the packages in T_EX Live didn't bring up any obvious candidate for breaking with this catcode change).

```

168 {\edef\reserved@a{\unqu@tefilef@und#1\@nil}%
169  \@addtofilelist{\string@makeletter\reserved@a}%
170  \UseHook{file/before}%

```

The current file name is available in `\CurrentFile` so we use that in the specific hook.

```

171  \UseHook{file/\CurrentFile/before}%
172  \@input #1% <- trailing space comes from \@filef@und
173  }%

```

And here, `\CurrentFile` is restored (by `\@expl@@@filehook@file@pop@assign@@nnnn`) so we can use it once more.

```

174  \UseHook{file/\CurrentFile/after}%
175  \UseHook{file/after}}
176 \def\unqu@tefilef@und"#1" \@nil{#1}

```

Now declare the non-generic file hooks used above:

```

177 \NewHook{file/before}
178 \NewReversedHook{file/after}
179 \<latexrelease>\EndIncludeInRelease
180 \</2kernel | latexrelease>

```

Now define `\InputIfFileExists` to input #1 if it seems to exist. Immediately prior to the input, #2 is executed. If the file #1 does not exist, execute '#3'.

```

207 \ExplSyntaxOn

```

`_filehook_subst_add:nn` `_filehook_subst_add:nn` declares a file substitution by doing a (global) definition of the form `\def\@file-subst@<file>{\<replacement>}`. The file names are properly sanitised, and normalized with the same treatment done for the file hooks. That is, a file replacement is declared by using the file name (and extension, if any) only, and the file path should not be given. If a file name is empty it is replaced by `.tex` (the empty `csname` is used to check that).

```

208 \cs_new_protected:Npn \_filehook_subst_add:nn #1 #2

265 <@@=>

2.6 Selecting a file (\set@curr@file)

\set@curr@file Now we hook into \set@curr@file to resolve a possible file substitution, and add \set@curr@file@nosearch \@expl@@@filehook@set@curr@file@@nNN at the end, after \@curr@file is set.

\curr@file A file name is built using \expandafter\string\csname{filename}\endcsname to avoid expanding utf8 active characters. The \csname expands the normalization machinery and the routine to resolve a file substitution, returning a control sequence with the same name as the file.

It happens that when {filename} is empty, the generated control sequence is \csname\endcsname, and doing \string on that results in the file csnameendcsname.tex. To guard against that we \ifx-compare the generated control sequence with the empty csname. To do so, \csname\endcsname has to be defined, otherwise it would be equal to \relax and we would have false positives. Here we define \csname\endcsname to expand to itself to avoid it matching the definition of some other control sequence.

266 </2ekernel>

Two file names are set here: \@curr@file@reqd which is the file requested by the user, and \@curr@file which should be the same, except when we have a file substitution, in which case it holds the actual loaded file. \@curr@file is resolved first, to check if a substitution happens. If it doesn't, \@expl@@@filehook@if@file@replaced@@TF short-cuts and just copies \@curr@file, otherwise the full normalization procedure is executed.

At this stage the file name is parsed and normalized, but if the input doesn't have an extension, the default .tex is *not* added to \@curr@file because for applications other than \input (graphics, for example) the default extension may not be .tex. First check if the input has an extension, then if the input had no extension, call

\@expl@@@filehook@drop@extension@@N. In case of a file substitution, \@curr@file will have an extension.

2.7 Replacing a file and detecting loops

`_filehook_resolve_file_subst:w` Start by sanitizing the file with `__filehook_file_parse_full_name:nN` then do `__filehook_file_subst_begin:nnn{<path>}{<name>}{<ext>}`.
`_filehook_normalize_file_name:w`
`_filehook_file_name_compose:nnn`

```

406 </2ekernel>
407 <*2ekernel | latexrelease>
408 <latexrelease>\IncludeInRelease{2020/10/01}%
409 <latexrelease> \\_filehook_resolve_file_subst:w{Replace files detect loops}%
410 \ExplSyntaxOn

```

```

411 \cs_new:Npn \__filehook_resolve_file_subst:w #1 \@nil
412 { \__filehook_file_parse_full_name:nN {#1} \__filehook_file_subst_begin:nnn }
413 \cs_new:Npn \__filehook_normalize_file_name:w #1 \@nil
414 { \__filehook_file_parse_full_name:nN {#1} \__filehook_file_name_compose:nnn }
415 \cs_new:Npn \__filehook_file_name_compose:nnn #1 #2 #3
416 { \tl_if_empty:nF {#1} { #1 / } #2#3 }

```

```

flag_\__filehook_file_replaced
\__filehook_if_file_replaced:TF
\__filehook_clear_replacement_flag:

```

Since the file replacement is done expandably in a `\csname`, use a flag to remember if a substitution happened. We use this in `\set@curr@file` to short-circuit some of it in case no substitution happened (by far the most common case, so it's worth optimizing). The flag raised during the file substitution algorithm must be explicitly cleared after the `__filehook_if_file_replaced:TF` conditional is no longer needed, otherwise further uses of `__filehook_if_file_replaced:TF` will wrongly return true.

```

417 \flag_new:n { \__filehook_file_replaced }
418 \cs_new:Npn \__filehook_if_file_replaced:TF #1 #2
419 { \flag_if_raised:nTF { \__filehook_file_replaced } {#1} {#2} }
420 \cs_new_protected:Npn \__filehook_clear_replacement_flag:
421 { \flag_clear:n { \__filehook_file_replaced } }

```

```

\__filehook_file_subst_begin:nnn

```

First off, start by checking if the current file ($\langle name \rangle + \langle ext \rangle$) has a declared substitution. If not, then just put that as the name (including a possible $\langle path \rangle$ in this case): this is the default case with no substitutions, so it's the first to be checked. The auxiliary `__filehook_file_subst_tortoise_hare:nn` sees that there's no replacement for `#2#3` and does nothing else.

```

422 \cs_new:Npn \__filehook_file_subst_begin:nnn #1 #2 #3
423 {
424   \__filehook_file_subst_tortoise_hare:nn { #2#3 } { #2#3 }
425   { \__filehook_file_name_compose:nnn {#1} {#2} {#3} }
426 }
427 \ExplSyntaxOff
428 \</2ekernel|latexrelease>
429 \<latexrelease>\EndIncludeInRelease
430 \<*2ekernel>

```

2.7.1 The Tortoise and Hare algorithm

```

\__filehook_file_subst_tortoise_hare:nn
\__filehook_file_subst_loop:NN
\__filehook_file_subst_loop:cc

```

If there is a substitution ($\langle true \rangle$ in the first `\cs_if_exist:cTF` below), then first check if there is no substitution down the line: this should be the second most common case, of one file replaced by another. In that case just leave the substitution there and the job is done. If any substitution happens, then the `\flag __filehook_file_replaced` is raised (conditionally, because checking if a flag is raised is much faster than raising it over and over again).

If, however there are more substitutions, then we need to check for a possible loop in the substitutions, which would otherwise put \TeX in an infinite loop if just an exhaustive expansion was used.

To detect a loop, the *Tortoise and Hare* algorithm is used. The name of the algorithm is an analogy to Aesop's fable, in which the Hare outruns a Tortoise. The two pointers here are the csnames which contains each file replacement, both of which start at the position zero, which is the file requested. In the inner part of the macro below, `__filehook_file_subst_loop:cc` is called with `\@file-subst@ $\langle file \rangle$` and `\@file-subst@\@file-subst@ $\langle file \rangle$` ; that is, the substitution of $\langle file \rangle$ and the substitution of that substitution: the Tortoise walks one step while the Hare walks two.

Within `__filehook_file_subst_loop:NN` the two substitutions are compared, and if they lead to the same file it means that there is a loop in the substitutions. If there's no loop, `__filehook_file_subst_tortoise_hare:nn` is called again with the Tortoise at position 1 and the hare at 2. Again, the substitutions are checked ahead of the Hare pointer to check that it won't run too far; in case there is no loop in the declarations, eventually one of the `\cs_if_exist:cTF` below will go *<false>* and the algorithm will end; otherwise it will run until the Hare reaches the same spot as the tortoise and a loop is detected.

```

431 </2ekernel>
432 <*2ekernel|latexrelease>
433 <latexrelease>\IncludeInRelease{2020/10/01}%
434 <latexrelease> {\__filehook_file_subst_tortoise_hare:nn}{Tortoise and Hare}%
435 \ExplSyntaxOn
436 \cs_new:Npn \__filehook_file_subst_tortoise_hare:nn #1 #2 #3
437 {
438   \cs_if_exist:cTF { @file-subst@ #2 }
439   {
440     \flag_if_raised:nF { __filehook_file_replaced }
441     { \flag_raise:n { __filehook_file_replaced } }
442     \cs_if_exist:cTF { @file-subst@ \use:c { @file-subst@ #2 } }
443     {
444       \__filehook_file_subst_loop:cc
445       { @file-subst@ #1 }
446       { @file-subst@ \use:c { @file-subst@ #2 } }
447     }
448     { \use:c { @file-subst@ #2 } }
449   }
450   { #3 }
451 }

```

This is just an auxiliary to check if a loop was found, and continue the algorithm otherwise. If a loop is found, the `.tex` file is used as fallback and `__filehook_file_subst_cycle_error:cN` is called to report the error.

```

452 \cs_new:Npn \__filehook_file_subst_loop:NN #1 #2
453 {
454   \token_if_eq_meaning:NNTF #1 #2
455   {
456     .tex
457     \__filehook_file_subst_cycle_error:cN { @file-subst@ #1 } #1
458   }
459   { \__filehook_file_subst_tortoise_hare:nn {#1} {#2} {#2} }
460 }
461 \cs_generate_variant:Nn \__filehook_file_subst_loop:NN { cc }

```

Showing this type of error expandably is tricky, as we have a very limited amount of characters to show and a potentially large list. As a work around, several errors are printed, each showing one step of the loop, until all the error messages combined show the loop.

```

462 \cs_new:Npn \__filehook_file_subst_cycle_error:NN #1 #2
463 {
464   \msg_expandable_error:nnff { latex2e } { file-cycle }
465   {#1} { \use:c { @file-subst@ #1 } }
466   \token_if_eq_meaning:NNTF #1 #2

```

```

467 { \_filehook\_file\_subst\_cycle\_error:cN { @file-subst@ #1 } #2 }
468 }
469 \cs_generate_variant:Nn \_filehook\_file\_subst\_cycle\_error:NN { c }
    And the error message:
470 \msg_new:nnn { latex2e } { file-cycle }
471 { File~loop!~#1~replaced~by~#2... }

2.8 Preventing a package from loading

We support the use case of preventing a package from loading but not any other type of files (e.g., classes).

`\disable@package@load` defines `\@pkg-disable@<package>` to expand to some code #2 instead of loading the package.

```

\reenable@package@load
\@disable@package@load@do
477 </2ekernel>
478 <*2ekernel | latexrelease>
479 <latexrelease>\IncludeInRelease{2020/10/01}%
480 <latexrelease>          {\disable@package@load}{Disable packages}%
481 \def\disable@package@load#1#2{%
482   \global\@namedef{@pkg-disable@#1.\@pkgextension}{#2}}

```

Here we check if a control sequence named `\@pkg-disable@<name>.sty` is defined, and if so don't use the package loading code #2, but use the replacement code stored in that control sequence, write something to the log, and then prevent `\@onefilewithoptions` from sanity-checking the requested package date (the `\expandafter` here triggers one in `\@onefilewithoptions` that ends a conditional there, and the `\@gobbletwo` removes the date checking code from the input stream).

```

483 \def\@disable@package@load@do#1#2{%
484   \@ifundefined{@pkg-disable@#1}%
485     {#2}%
486     {\@nameuse{@pkg-disable@#1}%
487       \@latex@info{Package '#1' has been disabled.%
488         \MessageBreak Load request ignored}%
489       \expandafter\@gobbletwo}}

```

`\reenable@package@load` undefines `\@pkg-disable@<package>` to realow loading a package.

```

490 \def\reenable@package@load#1{%
491   \global\expandafter\let
492   \csname @pkg-disable@#1.\@pkgextension \endcsname \@undefined}

493 </2ekernel | latexrelease>
494 <latexrelease>\EndIncludeInRelease
495 <latexrelease>\IncludeInRelease{0000/00/00}%

502 \*2ekernel)

```

(End of definition for \disable@package@load, \reenable@package@load, and \@disable@package@load@do. These functions are documented on page 968.)

2.9 High-level interfaces for L^AT_EX

None so far and the general feeling for now is that the hooks are enough. Packages like filehook, etc., may use them to set up their interfaces (samples are given below) but for the now the kernel will not provide any.

2.10 Internal commands needed elsewhere

Here we set up a few horrible (but consistent) L^AT_EX 2_ε names to allow for internal commands to be used outside this module (and in parts that still use L^AT_EX 2_ε syntax. We have to unset the @@ since we want double “at” sign in place of double underscores.

```

3 A sample package for structuring the log output

```

539 <*structuredlog>
540 <@@=filehook>

541 \ProvidesExplPackage
542   {structuredlog}{\ltfilehookdate}{\ltfilehookversion}
543   {Structuring the TeX transcript file}

```

`\g_filehook_nesting_level_int` Stores the current package nesting level.

```

544 \int_new:N \g_filehook_nesting_level_int

```

Initialise the counter with the number of files in the `\@currnamestack` (the number of items divided by 3) minus one, because this package is skipped when printing to the log.

```

545 \int_gset:Nn \g_filehook_nesting_level_int
546   { ( \tl_count:N \@currnamestack ) / 3 - 1 }

```

(End of definition for `\g_filehook_nesting_level_int`.)

`_filehook_log_file_record:n` This macro is responsible for increasing and decreasing the file nesting level, as well as printing to the log. The argument is either `STOPTART` or `STOP` and the action it takes on the nesting integer depends on that.

```

547 \cs_new_protected:Npn \_filehook_log_file_record:n #1
548   {
549     \str_if_eq:nnT {#1} {START} { \int_gincr:N \g_filehook_nesting_level_int }
550     \iow_term:x
551     {
552       \prg_replicate:nn { \g_filehook_nesting_level_int } { = } ~
553       ( LEVEL ~ \int_use:N \g_filehook_nesting_level_int \c_space_tl #1 ) ~
554       \CurrentFileUsed

```

If there was a file replacement, show that as well:

```

555       \str_if_eq:NNF \CurrentFileUsed \CurrentFile
556       { ~ ( \CurrentFile \c_space_tl requested ) }
557       \iow_newline:
558     }
559     \str_if_eq:nnT {#1} {STOP} { \int_gdecr:N \g_filehook_nesting_level_int }
560   }

```

Now just hook the macro above in the generic file/before...

```

561 \AddToHook{file/before}{ \_filehook_log_file_record:n { START } }
...and file/after hooks. We don't want to install the file/after hook immediately,
because that would mean it is the first time executed when the package finishes. We
therefore put the declaration inside \AddToHookNext so that it gets only installed when
we have left this package.
562 \AddToHookNext{file/after}
563   { \AddToHook{file/after}{ \_filehook_log_file_record:n { STOP } } }
(End of definition for \_filehook_log_file_record:n.)
564 <@@=>
565 </structuredlog>

```

4 Package emulations

4.1 Package atveryend emulation

With the new hook management and the hooks in \enddocument all of atveryend is taken care of. We can make an emulation only here after the substitution functionality is available:

```

566 <*2ekernel>
567 \declare@file@substitution{atveryend.sty}{atveryend-ltx.sty}
568 </2ekernel>

```

Here is the package file we point to:

```

569 <*atveryend-ltx>
570 \ProvidesPackage{atveryend-ltx}
571   [2020/08/19 v1.0a
572     Emulation of the original atveryend package^^Jwith kernel methods]

```

Here are new definitions for its interfaces now pointing to the hooks in \enddocument

```

573 \newcommand\AfterLastShipout {\AddToHook{enddocument/afterlastpage}}
574 \newcommand\AtVeryEndDocument {\AddToHook{enddocument/afteraux}}

```

Next one is a bit of a fake, but the result should normally be as expected. If not, one needs to add a rule to sort the code chunks in enddocument/info.

```

575 \newcommand\AtEndAfterFileList{\AddToHook{enddocument/info}}
576 \newcommand\AtVeryVeryEnd {\AddToHook{enddocument/end}}

```

\BeforeClearDocument This one is the only one we don't implement or rather don't have a dedicated hook in the code.

```

577 \ExplSyntaxOn
578 \newcommand\BeforeClearDocument[1]
579   { \AtEndDocument{#1}
580     \atveryend@DEPRECATED{BeforeClearDocument \tl_to_str:n{#1}}
581   }
582 \cs_new:Npn\atveryend@DEPRECATED #1
583   {\iow_term:x{=====~DEPRECATED~USAGE~#1~=====}}
584 \ExplSyntaxOff
(End of definition for \BeforeClearDocument.)
585 </atveryend-ltx>

```

File Z

ltshipout.dtx

1 Introduction

The code provides an interface to the `\shipout` primitive of \TeX which is called when a finished pages is finally “shipped out” to the target output file, e.g., the `.dvi` or `.pdf` file. A good portion of the code is based on ideas by Heiko Oberdiek implemented in his packages `atbegshi` and `atenddvi` even though the interfaces are somewhat different.⁴⁸

1.1 Overloading the `\shipout` primitive

`\shipout` With this implementation \TeX ’s shipout primitive is no longer available for direct use. Instead `\shipout` is running some (complicated) code that picks up the box to be shipped out regardless of how that is done, i.e., as a constructed `\vbox` or `\hbox` or as a box register.

It then stores it in a named box register. This box can then be manipulated through a set of hooks after which it is shipped out for real.

Each shipout that actually happens (i.e., where the material is not discarded for one or the other reason) is recorded and the total number is available in a readonly variable and in a \LaTeX counter.

`\RawShipout` This command implements a simplified shipout that bypasses the foreground and background hooks, e.g., only `shipout/firstpage` and `shipout/lastpage` are executed and the total shipout counters are incremented.

The command doesn’t use `\ShipoutBox` but its own private box register so that it can be used inside of shipout hooks to do some additional shipouts while already in the output routine with the current page being stored in `\ShipoutBox`. It does have access to `\ShipoutBox` if it is used in `shipout/before` (or `shipout/after`) and can use its content.

It is safe to use it in `shipout/before` or `shipout/after` but not necessarily in the other `shipout/...` hooks as they are intended for special processing.

⁴⁸Heiko’s interfaces are emulated by the kernel code, if a document requests his packages, so older documents will continue to work.

| | |
|---|--|
| <code>\ShipoutBox</code> <code>\l_shipout_box</code> | This box register is called <code>\ShipoutBox</code> (alternatively available via the L3 name <code>\l_shipout_box</code>). |
|---|--|

This box is a “local” box and assignments to it should be done only locally. Global assignments (as done by some packages with older code where this box is known as 255) may work but they are conceptually wrong and may result in errors under certain circumstances.

During the execution of `shipout/before` this box contains the accumulated material for the page, but not yet any material added by other shipout hooks. During execution of `shipout/after`, i.e., after the shipout has happened, the box also contains any background or foreground material.

Material from the hooks `shipout/firstpage` or `shipout/lastpage` is not included (but only used during the actual shipout) to facilitate reuse of the box data (e.g., `shipout/firstpage` material should never be added to a later page of the output).

| |
|--|
| <code>\l_shipout_box_ht_dim</code> <code>\l_shipout_box_dp_dim</code> <code>\l_shipout_box_wd_dim</code> <code>\l_shipout_box_ht_plus_dp_dim</code> |
|--|

The shipout box dimensions are available in the L3 registers `\l_shipout_box_ht_dim`, etc. (there are no L^AT_EX 2_ε names).⁴⁹ These variables can be used inside the hook code for `shipout/before`, `shipout/foreground` and `shipout/background` if needed.

1.2 Provided hooks

| | |
|--|---|
| <code>shipout/before</code> <code>shipout/after</code> <code>shipout/foreground</code> <code>shipout/background</code> <code>shipout/firstpage</code> <code>shipout/lastpage</code> | <p>The code for <code>\shipout</code> offers a number of hooks into which packages (or the user) can add code to support different use cases. These are:</p> <p><code>shipout/before</code> This hook is executed after the finished page has been stored in <code>\ShipoutBox</code> / <code>\l_shipout_box</code>. It can be used to alter that box content or to discard it completely (see <code>\DiscardShipoutBox</code> below).</p> |
|--|---|

You can use `\RawShipout` inside this hook for special use cases. It can make use of `\ShipoutBox` (which doesn’t yet include the background and foreground material).

Note: It is not possible (or say advisable) to try and use this hook to typeset material with the intention to return it to main vertical list, it will go wrong and give unexpected results in many cases—for starters it will appear after the current page not before or it will vanish or the vertical spacing will be wrong!

`shipout/background` This hook adds a picture environment into the background of the page with the (0,0) coordinate in the top-left corner using a `\unitlength` of 1pt.

It should therefore only receive `\put` commands or other commands suitable in a `picture` environment and the vertical coordinate values would normally be negative.

⁴⁹Might need changing, but HO’s version as strings is not really helpful I think).

Technically this is implemented by adding a zero-sized `\hbox` as the very first item into the `\ShipoutBox` containing that `picture` environment. Thus the rest of the box content will overprint what ever is typeset by that hook.

shipout/foreground This hook adds a picture environment into the foreground of the page with the (0,0) coordinate in the top-left corner using a `\unitlength` of 1pt. Technically this is implemented by adding a zero-sized `\hbox` as the very last item into the `\ShipoutBox` and raising it up so that it still has its (0,0) point in the top-left corner. But being placed after the main box content it will be typeset later and thus overprints it (i.e., is in the foreground).

shipout This hook is executed after foreground and/or background material has been added, i.e., just in front of the actual shipout operation. Its purpose is to allow manipulation of the finalized box (stored in `\ShipoutBox`) with the extra material also in place (which is not yet the case in `shipout/before`).

It cannot be used to cancel the shipout operation via `\DiscardShipoutBox` (that has to happen in `shipout/before`, if desired!

shipout/firstpage The material from this hook is executed only once at the very beginning of the first output page that is shipped out (i.e., not discarded at the last minute). It should only contain `\special` or similar commands needed to direct post processors handling the .dvi or .pdf output.⁵⁰

This hook is added to the very first page regardless of how it is shipped out (i.e., with `\shipout` or `\RawShipout`).

shipout/lastpage The corresponding hook to add `\specials` at the very end of the output file. It is only executed on the very last page of the output file — or rather on the page that \LaTeX believes is the last one. Again it is executed regardless of the shipout method.

It may not be possible for \LaTeX to correctly determine which page is the last one without several reruns. If this happens and the hook is non-empty then \LaTeX will add an extra page to place the material and also request a rerun to get the correct placement sorted out.

shipout/after This hook is executed after a shipout has happened. If the shipout box is discarded this hook is not looked at.

You can use `\RawShipout` inside this hook for special use cases and the main `\ShipoutBox` is still available at this point (but in contrast to `shipout/before` it now includes the background and foreground material).

Note: Just like `shipout/before` this hook is not meant to be used for adding typeset material back to the main vertical list—it might vanish or the vertical spacing will be wrong!

As mentioned above the hook `shipout/before` is executed first and can manipulate the prepared shipout box stored in `\ShipoutBox` or set things up for use in `\write` during the actual shipout. It is even run if there was a `\DiscardShipoutBox` request in the document.

The other hooks (except `shipout` and `shipout/after`) are added inside `hboxes` to the box being shipped out in the following order:

⁵⁰In \LaTeX 2_ϵ that was already existing, but implemented using a box register with the name `\@begindvibox`.

| | |
|--|------------------------|
| <code>shipout/firstpage</code> | only on the first page |
| <code>shipout/background</code> | |
| <code><i><boxed content of \ShipoutBox></i></code> | |
| <code>shipout/foreground</code> | |
| <code>shipout/lastpage</code> | only on the last page |

If any of the hooks has no code then the corresponding box is added at that point.

Once the (page) box has got the above extra content it can again be manipulated using the `shipout` hook and then is shipped out for real.

Once the (page) box has been shipped out the `shipout/after` hook is called (while you are still inside the output routine). It is not called if the shipout box was discarded.

In a document that doesn't produce pages, e.g., only makes `\typeouts`, none of the hooks are ever executed (as there is no `\shipout`) not even the `shipout/lastpage` hook.

If `\RawShipout` is used instead of `\shipout` then only the hooks `shipout/firstpage` and `shipout/lastpage` are executed (on the first or last page), all others are bypassed.

1.3 Legacy L^AT_EX commands

| | |
|--------------------------|---|
| <code>\AtBeginDvi</code> | <code>\AtBeginDvi {<code>}</code> |
| <code>\AtEndDvi</code> | <code>\AtBeginDvi</code> is the existing L ^A T _E X 2 _ε interface to fill the <code>shipout/firstpage</code> hook. This is not really a good name as it is not just supporting <code>.dvi</code> but also <code>.pdf</code> output or <code>.xdv</code> . |

`\AtEndDvi` is the counterpart that was not available in the kernel but only through the package `atenddvi`. It fills the `shipout/lastpage` hook.

Neither interface can set a code label but uses the current default label.

As these two wrappers have been available for a long time we continue offering them (but not enhancing them, e.g., by providing support for code labels).

For new code we strongly suggest using the high-level hook management commands directly instead of “randomly-named” wrappers. This will lead to code that is easier to understand and to maintain and it also allows you to set code labels if needed.

For this reason we do not provide any other “new” wrapper commands for the above hooks in the kernel, but only keep the existing ones for backward compatibility.

1.4 Special commands for use inside the hooks

| | |
|---|---|
| <code>\DiscardShipoutBox</code> <code>\shipout_discard:</code> | <code>\AddToHookNext {shipout/before} {...\DiscardShipoutBox...}</code> |
|---|---|

The `\DiscardShipoutBox` declaration (L3 name `\shipout_discard:`) requests that on the next shipout the page box is thrown away instead of being shipped to the `.dvi` or `.pdf` file.

Typical applications wouldn't do this unconditionally, but have some processing logic that decides to use or not to use the page.

Note that if this declaration is used directly in the document it may depend on the placement to which page it applies, given that \LaTeX output routine is called in an asynchronous manner! Thus normally one would use this only as part of the `shipout/before` code.

Todo: Once we have a new mark mechanism available we can improve on that and make sure that the declaration applies to the page that contains it — not done (yet)

`\DiscardShipoutBox` cannot be used in any of the `shipout/...` hooks other than `shipout/before`.

In the `atbegshi` package there are a number of additional commands for use inside the `shipout/before` hook. They should normally not be needed any more as one can instead simply add code to the hooks `shipout/before`, `shipout`, `shipout/background` or `shipout/foreground`.⁵¹ If `atbegshi` gets loaded then those commands become available as public functions with their original names as given below.

1.5 Provided \LaTeX callbacks

| | |
|---------------------------------|--|
| <code>pre_shipout_filter</code> | Under \LaTeX the <code>pre_shipout_filter</code> Lua callback is provided which gets called directly after the <code>shipout</code> hook, immediately before the shipout primitive gets invoked. The signature is |
|---------------------------------|--|

```
function(<node> head)
  return true
end
```

The `head` is the list node corresponding to the box to be shipped out. The return value should always be `true`.

⁵¹If that assumption turns out to be wrong it would be trivial to change them to public functions (right now they are private).

1.6 Information counters

| | |
|--------------------------------------|---|
| <code>\ReadonlyShipoutCounter</code> | <code>\ifnum\ReadonlyShipoutCounter=...</code> |
| <code>\g_shipout_readonly_int</code> | <code>\int_use:N \g_shipout_readonly_int % expl3 usage</code> |

This integer holds the number of pages shipped out up to now (including the one to be shipped out when inside the output routine). More precisely, it is incremented only after it is clear that a page will be shipped out, i.e., after the `shipout/before` hook (because that might discard the page)! In contrast `shipout/after` sees the incremented value.

Just like with the `page` counter its value is only accurate within the output routine. In the body of the document it may be off by one as the output routine is called asynchronously!

Also important: it *must not* be set, only read. There are no provisions to prevent that restriction, but if you manipulate it, chaos will be the result. To emphasize this fact it is not provided as a \LaTeX counter but as a \TeX counter (i.e., a command), so `\Alph{\ReadonlyShipoutCounter}` etc, would not work.

| | |
|--|--|
| <code>totalpages</code> | <code>\arabic{totalpages}</code> |
| <code>\g_shipout_totalpages_int</code> | <code>\int_use:N \g_shipout_totalpage_int % expl3 usage</code> |

In contrast to `\ReadonlyShipoutCounter`, the `totalpages` counter is a \LaTeX counter and incremented for each shipout attempt including those pages that are discarded for one or the other reason. Again `shipout/before` sees the counter before it is incremented. In contrast `shipout/after` sees the incremented value.

Furthermore, while it is incremented for each page, its value is never used by \LaTeX . It can therefore be freely reset or changed by user code, for example, to additionally count a number of pages that are not build by \LaTeX but are added in a later part of the process, e.g., cover pages or picture pages made externally.

Important: as this is a page-related counter its value is only reliable inside the output routine!

| | |
|----------------------------------|---|
| <code>\PreviousTotalPages</code> | <code>\thetotalpages/\PreviousTotalPages</code> |
|----------------------------------|---|

Command that expands to the number of total pages from the previous run. If there was no previous run or if used in the preamble it expands to 0. Note that this is a command and not a counter, so in order to display the number in, say, Roman numerals you have to assign its value to a counter and then use `\Roman` on that counter.

1.7 Debugging shipout code

| | |
|----------------------------------|--|
| <code>\DebugShipoutsOn</code> | <code>\DebugShipoutsOn</code> |
| <code>\DebugShipoutsOff</code> | |
| <code>\shipout_debug_on:</code> | Turn the debugging of shipout code on or off. This displays changes made to the shipout data structures. |
| <code>\shipout_debug_off:</code> | |

Todo: This needs some rationalizing and may not stay this way.

2 Emulating commands from other packages

The packages in this section are no longer necessary, but as they are used by other packages, they are emulated when they are explicitly loaded with `\usepackage` or `\RequirePackage`.

Please note that the emulation only happens if the package is explicitly requested, i.e., the commands documented below are not automatically available in the L^AT_EX kernel! If you write a new package we suggest to use the appropriate kernel hooks directly instead of loading the emulation.

2.1 Emulating `atbegshi`

| | |
|---|--|
| <code>\AtBeginShipoutUpperLeft</code> | <code>\AddToHook {shipout/before}</code> |
| <code>\AtBeginShipoutUpperLeftForeground</code> | <code>{... \AtBeginShipoutUpperLeft{<code>}...}</code> |

This adds a `picture` environment into the background of the shipout box expecting `<code>` to contain `picture` commands. The same effect can be obtained by simply using kernel features as follows:

`\AddToHook{shipout/background}{<code>}`

There is one technical difference: if `\AtBeginShipoutUpperLeft` is used several times each invocation is put into its own box inside the shipout box whereas all `<code>` going into `shipout/background` ends up all in the same box in the order it is added or sorted based on the rules for the hook chunks.

`\AtBeginShipoutUpperLeftForeground` is similar with the difference that the `picture` environment is placed in the foreground. To model it with the kernel functions use the hook `shipout/foreground` instead.

| | |
|--|---|
| <code>\AtBeginShipoutAddToBox</code> | <code>\AddToHook {shipout/before} {... \AtBeginShipoutAddToBox{<code>}...}</code> |
| <code>\AtBeginShipoutAddToBoxForeground</code> | |

These work like `\AtBeginShipoutUpperLeft` and `\AtBeginShipoutUpperLeftForeground` with the difference that `<code>` is directly placed into an `\hbox` inside the shipout box and not surrounded by a `picture` environment.

To emulate them using `shipout/background` or `shipout/foreground` you may have to wrap `<code>` into a `\put` statement but if the code is not doing any typesetting just adding it to the hook should be sufficient.

| | |
|---------------------------------|--|
| <code>\AtBeginShipoutBox</code> | This is the name of the shipout box as <code>atbegshi</code> knows it. |
|---------------------------------|--|

| |
|---|
| <code>\AtBeginShipoutOriginalShipout</code> |
|---|

This is the name of the `\shipout` primitive as `atbegshi` knows it. This bypasses all the mechanisms set up by the L^AT_EX kernel and there are various scenarios in which it can therefore fail. It should only be used to run existing legacy `atbegshi` code but not in newly developed applications.

The kernel alternative is `\RawShipout` which is integrated with the L^AT_EX mechanisms and updates, for example, the `\ReadonlyShipoutCounter` counter. Please use `\RawShipout` for new code if you want to bypass the before, foreground and background hooks.

| | | |
|-------------|--|---|
| <hr/> <hr/> | <code>\AtBeginShipoutInit</code> | By default <code>atbegshi</code> delayed its action until <code>\begin{document}</code> . This command was forcing it in an earlier place. With the new concept it does nothing. |
| <hr/> <hr/> | <code>\AtBeginShipout</code> <code>\AtBeginShipoutNext</code> | <code>\AtBeginShipout{<code>} ≡ \AddToHook{shipout/before}{<code>}</code> <code>\AtBeginShipoutNext{<code>} ≡ \AddToHookNext{shipout/before}{<code>}</code> This is equivalent to filling the <code>shipout/before</code> hook by either using <code>\AddToHook</code> or <code>\AddToHookNext</code> , respectively. |
| <hr/> <hr/> | <code>\AtBeginShipoutFirst</code> <code>\AtBeginShipoutDiscard</code> | The <code>atbegshi</code> names for <code>\AtBeginDvi</code> and <code>\DiscardShipoutBox</code> . |

2.2 Emulating everyshi

The `everyshi` package is providing commands to run arbitrary code just before the shipout starts. One point of difference: in the new shipout hooks the page is available as `\ShipoutBox` for inspection of change, one should not manipulate box 255 directly inside `shipout/before`, so old code doing this would change to use `\ShipoutBox` instead of 255 or `\@cclv`.

| | | |
|-------------|-----------------------------|--|
| <hr/> <hr/> | <code>\EveryShipout</code> | <code>\EveryShipout{<code>} ≡ \AddToHook{shipout/before}{<code>}</code> |
| <hr/> <hr/> | <code>\AtNextShipout</code> | <code>\AtNextShipout{<code>} ≡ \AddToHookNext{shipout/before}{<code>}</code> |

However, most use cases for `everyshi` are attempts to put some picture or text into the background or foreground of the page and that can be done today simply by using the `shipout/background` and `shipout/foreground` hooks without any need to coding.

2.3 Emulating atenddvi

The `atenddvi` package implemented only a single command: `\AtEndDvi` and that is now available out of the box so the emulation makes the package a no-op.

2.4 Emulating everypage

This package patched the original `\@begindvi` hook and replaced it with its own version. Its functionality is now covered by the hooks offered by the kernel so that there is no need for such patching any longer.

| | | |
|-------------|--------------------------------|---|
| <hr/> <hr/> | <code>\AddEverypageHook</code> | <code>\AddEverypageHook{<code>} ≡</code> <code>\AddToHook{shipout/background}{\put(1in,-1in){<code>}}</code> <code>\AddEverypageHook</code> is adding something into the background of every page at a position of 1in to the right and 1in down from the top left corner of the page. By using the kernel hook directly you can put your material directly to the right place, i.e., use other coordinates in the <code>\put</code> statement above. |
| <hr/> <hr/> | <code>\AddThispageHook</code> | <code>\AddThispageHook{<code>} ≡</code> <code>\AddToHookNext{shipout/background}{\put(1in,-1in){<code>}}</code> The <code>\AddThispageHook</code> wrapper is similar but uses <code>\AddToHookNext</code> . |

3 The Implementation

1 `<@@=shipout>`

At the moment the whole module rolls back in one go, but if we make any modifications in later releases this will then need splitting.

```
2 <*2ekernel | latexrelease>
3 <latexrelease>\IncludeInRelease{2020/10/01}%
4 <latexrelease>          {\shipout}{Hook management (shipout)}%
5 \ExplSyntaxOn
```

3.1 Debugging

`\g__shipout_debug_bool` Holds the current debugging state.

```
6 \bool_new:N \g__shipout_debug_bool
```

(End of definition for `\g__shipout_debug_bool`.)

`\shipout_debug_on:` Turns debugging on and off by redefining `__shipout_debug:n`.

```
\shipout_debug_off:
\__shipout_debug:n
\__shipout_debug_gset:
7 \cs_new_eq:NN \__shipout_debug:n \use_none:n
8 \cs_new_protected:Npn \shipout_debug_on:
9   {
10     \bool_gset_true:N \g__shipout_debug_bool
11     \__shipout_debug_gset:
12   }
13 \cs_new_protected:Npn \shipout_debug_off:
14   {
15     \bool_gset_false:N \g__shipout_debug_bool
16     \__shipout_debug_gset:
17   }
18 \cs_new_protected:Npn \__shipout_debug_gset:
19   {
20     \cs_gset_protected:Npx \__shipout_debug:n ##1
21     { \bool_if:NT \g__shipout_debug_bool {##1} }
22   }
```

(End of definition for `\shipout_debug_on:` and others. These functions are documented on page 992.)

`\ShipoutBox` The box filled with the page to be shipped out (both L³ and L^AT_EX 2_ε name).

```
\l_shipout_box
23 \box_new:N \l_shipout_box
24 \cs_set_eq:NN \ShipoutBox \l_shipout_box
```

(End of definition for `\ShipoutBox` and `\l_shipout_box`. These functions are documented on page 988.)

`\l__shipout_raw_box` The `\RawShipout` gets its own box but it is internal as there is no hook manipulation for it.

```
25 \box_new:N \l__shipout_raw_box
```

(End of definition for `\l__shipout_raw_box`.)

`__shipout_finalize_box:` For LuaTeX invoke the `pre_shipout_filter` callback.

```
26 \sys_if_engine luatex:TF
27 {
28   \newprotectedluacmd \__shipout_finalize_box:
29   \exp_args:Nx \everyjob {
30     \exp_not:V \everyjob
31     \exp_not:N \lua_now:n {
32       luatexbase.create_callback('pre_shipout_filter', 'list')
33       local~call, getbox, setbox = luatexbase.call_callback, tex.getbox, tex.setbox~
34       lua.get_functions_table()[\the \allocationnumber] = function()
35         local~head = getbox(\the \l_shipout_box)
36         local~result = call('pre_shipout_filter', head)
37         if~not (result == head) then~
38           setbox(\the \l_shipout_box, result~or~nil)
39         end~
40       end
41     }
42   }
43 } {
44   \cs_set_eq:NN \__shipout_finalize_box: \scan_stop:
45 }
```

(End of definition for __shipout_finalize_box:.)

`__shipout_execute:` This is going to be the code run by `\shipout`. The code follows closely the ideas from `atbegshi`, so not documenting that here for now.

```
46 \cs_set_protected:Npn \__shipout_execute: {
47   \tl_set:Nx \l__shipout_group_level_tl
48   { \int_value:w \tex_currentgrouplevel:D }
49   \tex_afterassignment:D \__shipout_execute_test_level:
50   \tex_setbox:D \l_shipout_box
51 }
```

(End of definition for __shipout_execute:.)

\shipout Overloading the `\shipout` primitive:

```
52 \cs_gset_eq:NN \shipout \__shipout_execute:
```

(End of definition for \shipout. This function is documented on page 987.)

`\l__shipout_group_level_tl` Helper token list to record the group level at which `__shipout_execute:` is encountered.

```
53 \tl_new:N \l__shipout_group_level_tl
```

(End of definition for \l__shipout_group_level_tl.)

`__shipout_execute_test_level:` If the group level has changed then we are still constructing `\l_shipout_box` and to continue we need to wait until the current group has finished, hence the `\tex_aftergroup:D`.

```
54 \cs_new:Npn \__shipout_execute_test_level: {
55   \int_compare:nNnT
56   \l__shipout_group_level_tl < \tex_currentgrouplevel:D
57   \tex_aftergroup:D \__shipout_execute_cont:
58 }
```

(End of definition for __shipout_execute_test_level:.)

`__shipout_execute_cont:` This does the actual shipout running several hooks as part of it. The code for them is passed as argument #2 to #4 to `__shipout_execute_main_cont:Nnnn`; the first argument is the box to be shipped out.

```

59 \cs_new:Npn \__shipout_execute_cont: {
60   \__shipout_execute_main_cont:Nnnn
61   \l_shipout_box
62   { \hook_use:n {shipout/before} }
63   { \hook_if_empty:nF {shipout/foreground}
64     { \__shipout_add_foreground_picture:n
65       { \hook_use:n {shipout/foreground} } } }

```

If the user hook for the background (`shipout/background`) has no code, there might still code in the kernel hook so we need to test for this too. We only test for the `\@kernel@before@shipout@background` though. If the `\@kernel@after@shipout@background` needs executing even if the user hook is empty then we can add another test (or the kernel could put something into the before hook).

```

66   \bool_lazy_and:nnF
67   { \hook_if_empty_p:n {shipout/background} }
68   { \tl_if_empty_p:N \@kernel@before@shipout@background }
69   { \__shipout_add_background_picture:n
70     { \@kernel@before@shipout@background
71       \hook_use:n {shipout/background}
72       \@kernel@after@shipout@background }
73   }
74 }
75 { \hook_use:n {shipout/after} }
76 }

```

(End of definition for `__shipout_execute_cont:`)

`_shipout_execute_main_cont:Nnnn` When we have reached this point the shipout box has been processed and is available in `\l_shipout_box` and ready for real ship out (unless it gets discarded during the process).

The three arguments hold hook code that is executed just before the actual shipout (#1), within the shipout adding background and foreground material (#2) and after the shipout has happened (#3). These are passed as arguments because the same code without those hooks is also used when doing a “raw” shipout implemented by `\RawShipout`. The only hook that is always executed is that for the very last page, i.e., `shipout/lastpage`.

First we quickly check if it is void (can’t happen in the standard L^AT_EX output routine but `\shipout` might be called from a package that has some special processing logic). If it is void we aren’t shipping anything out and processing ends.⁵²

```

77 \cs_new:Npn \__shipout_execute_main_cont:Nnnn #1#2#3#4 {
78   \box_if_empty:NTF #1
79   { \@latex@warning@no@line{ Ignoring~ void~ shipout~ box } }
80   {

```

Otherwise we assume that we will ship something and prepare for final adjustments (in particular setting the state of `\protect` while we are running the hook code). We also save the current `\protect` state to restore it later.

```

81 %       \bool_gset_false:N \g__shipout_discard_bool % setting this would disable
82                                     % \DiscardShipoutBox on doc-level

```

⁵²In that case we don’t reset the deadcycles, that would be up to the OR processing logic to do.

```

83      \cs_set_eq:NN \__shipout_saved_protect: \protect
84      \set@typeset@protect

```

We also store the current shipout box dimension in registers, so that they can be used in the hook code.⁵³

```

85      \__shipout_get_box_size:N #1

```

Then we execute the `shipout/before` hook (or nothing in case of `\RawShipout`).

```

86      #2

```

In `\g_shipout_totalpages_int` we count all shipout attempts so we increment that counter already here (the other one is incremented later when we know for sure that we do a `\shipout`).

We increment it after running the above hook so that the values for `\g_shipout_totalpages_int` and `\g_shipout_readonly_int` are in sync while the hook is executed (in the case that `totalpages` isn't manually altered or through discarding pages that is).

```

87      \int_gincr:N \g_shipout_totalpages_int

```

The above hook might contain code that requests the page to be discarded so we now test for it.

```

88      \bool_if:NTF \g__shipout_discard_bool
89      { \@latex@info@no@line{Completed~ page~ discarded}
90      \bool_gset_false:N \g__shipout_discard_bool

```

As we are discarding the page box and not shipping anything out, we need to do some house cleaning and reset T_EX's deadcycles so that it doesn't complain about too many calls to the OR without any shipout.

```

91      \tex_deadcycles:D \c_zero_int

```

Todo: In atbegshi the box was dropped but is that actually needed? Or the resetting of \protect to its kernel value?

```

92 %      \group_begin:
93 %      \box_set_eq_drop:NN #1 #1
94 %      \group_end:
95 %      \cs_set_eq:NN \protect \exp_not:N
96      }

```

Even if there was no explicit request to discard the box it is possible that the code for the hook `shipout/before` has voided the box (by mistake or deliberately). We therefore test once more but this time make it a warning, because the best practice way is to use the request mechanism.

```

97      { \box_if_empty:NTF #1
98      { \@latex@warning@no@line { Ignoring~ void~ shipout~ box.
99      \MessageBreak The~ shipout~ box~ was~ voided~ by~ hook~ code }
100      }

```

Finally, if the box is still non-empty we are nearly ready to ship it out. First we increment the total page counter so that we can later test if we have reached the final page according to our available information.⁵⁴

```

101      {

```

⁵³This is not really necessary as the code could access them via `\box_ht:N`, etc., but it is perhaps convenient.

⁵⁴Doing that earlier would be wrong because we might end up with the last page counted but discard and then we have no place to add the final objects into the output file.

```

102         \int_gincr:N \g_shipout_readonly_int
103         \__shipout_debug:n {
104             \typeout{Absolute~ page~ =~ \int_use:N \g_shipout_readonly_int
105                 \space (target:~ \@abspage@last)}
106         }

```

Then we store the box sizes again (as they may have changed) and then look at the hooks `shipout/foreground` and `shipout/background`. If either or both are non-empty we add a `picture` environment to the box (in the foreground and/or in the background) and execute the hook code inside that environment.

```

107         \__shipout_get_box_size:N #1

```

The first hook we run is the `shipout/firstpage` hook. This is only done once, then the `__shipout_run_firstpage_hook:` command redefines itself to do nothing. If the hook contains `\specials` for integration at the top of the page they will be temporarily stored in a safe place and added later with `__shipout_add_firstpage_specials:`.

```

108         \__shipout_run_firstpage_hook:

```

Run the hooks for background and foreground or, if this is called by `\RawShipout`, copy the box `\l__shipout_raw_box` to `\l_shipout_box` so that firstpage and lastpage material gets added if necessary (that is always done to `\l_shipout_box`).

```

109         #3

```

We then run `__shipout_add_firstpage_specials:` that adds the content of the hook `shipout/firstpage` to the start of the first page (if non-empty). It is then redefined to do nothing on later pages.

```

110         \__shipout_add_firstpage_specials:

```

Then we check if we have to add the `shipout/lastpage` hook or the corresponding kernel hook because we have reached the last page. This test will be false for all but one (and hopefully the correct) page.

```

111         \int_compare:nNnT \@abspage@last = \g_shipout_readonly_int
112         { \bool_lazy_and:nnF
113             { \hook_if_empty_p:n {shipout/lastpage} }
114             { \tl_if_empty_p:N \@kernel@after@shipout@lastpage }
115             { \__shipout_debug:n { \typeout{Executing~ lastpage~ hook~
116                 on~ page~ \int_use:N \g_shipout_readonly_int } }
117                 \__shipout_add_foreground_box:n
118                 { \UseHook{shipout/lastpage}
119                     \@kernel@after@shipout@lastpage }

```

We record that we have handled the `shipout/lastpage` hook but only if we really did.

```

120         \bool_gset_true:N \g__shipout_lastpage_handled_bool
121     }
122 }

```

```

123         \hook_use:n {shipout}
124         \__shipout_finalize_box:

```

Finally we run the actual `TEX` primitive for `shipout`. As that will expand delayed `\write` statements inside the page in which protected commands should not expand we first change `\protect` to the appropriate definition for that case.

```

125         \cs_set_eq:NN \protect \exp_not:N
126         \tex_shipout:D \box_use:N \l_shipout_box

```

The `\l_shipout_box` may contain the firstpage material if this was the very first shipout. That makes it unsuitable for reuse in another shipout, so as a safety measure the next command resets `\l_shipout_box` to its earlier state if that is necessary. On later pages this is then a no-op.

```
127             \__shipout_drop_firstpage_specials:
```

The `shipout/after` hook (if in #4) needs to run with `\protected` commands again being executed, because that hook will “typeset” material added at the top of the next page.

```
128             \set@typeset@protect
129             #4
130         }
131     }
```

Restore the value of `\protect` in case `\shipout` is called outside of the output routine (where it is automatically restored because of the implicit group).

```
132     \cs_set_eq:NN \protect \__shipout_saved_protect:
133 }
134 }
```

(End of definition for __shipout_execute_main_cont:Nnnn.)

`__shipout_execute_raw:` This implements the “raw” shipout which bypasses the before, foreground, background and after hooks. It follows the same pattern than `__shipout_execute_raw:` except that it finally calls `__shipout_execute_main_cont:Nnnn` with three empty arguments. instead of the hook code.

```
135 \cs_set_protected:Npn \__shipout_execute_raw: {
136     \tl_set:Nx \l__shipout_group_level_tl
137     { \int_value:w \tex_currentgrouplevel:D }
138     \tex_afterassignment:D \__shipout_execute_test_level_raw:
139     \tex_setbox:D \l__shipout_raw_box
140 }

141 \cs_new:Npn \__shipout_execute_test_level_raw: {
142     \int_compare:nNnT
143     \l__shipout_group_level_tl < \tex_currentgrouplevel:D
144     \tex_aftergroup:D \__shipout_execute_nohooks_cont:
145 }
```

Well, not totally empty arguments, we add some debugging if we are actually doing a shipout.

```
146 \cs_new:Npn \__shipout_execute_nohooks_cont: {
147     \__shipout_execute_main_cont:Nnnn \l__shipout_raw_box
148     {} { \__shipout_debug:n{ \typeout{Doing~ raw~ shipout~ ...} } }
149     \box_set_eq:NN \l_shipout_box \l__shipout_raw_box } {}
150 }
```

(End of definition for __shipout_execute_raw: and __shipout_execute_test_level_raw:.)

\RawShipout The interface name for raw shipout.

```
151 \cs_gset_eq:NN \RawShipout \__shipout_execute_raw:
```

(End of definition for \RawShipout. This function is documented on page 987.)

`__shipout_saved_protect:` Remember the current `\protect` state.

```
152 \cs_new_eq:NN \__shipout_saved_protect: \protect
```

(End of definition for `_shipout_saved_protect:`.)

```

shipout/before  Declaring all hooks for the shipout code.
               shipout
               shipout/after
shipout/foreground \hook_new:n{shipout/after}
shipout/background \hook_new:n{shipout/foreground}
shipout/firstpage \hook_new:n{shipout/background}
shipout/lastpage  \hook_new:n{shipout/firstpage}
               \hook_new:n{shipout/lastpage}

```

(End of definition for `shipout/before` and others. These functions are documented on page 988.)

```

\@kernel@after@shipout@lastpage And here are the internal kernel hooks going before or after the public ones where needed.
\@kernel@before@shipout@background
\@kernel@after@shipout@background
160 \let\@kernel@after@shipout@lastpage\@empty
161 \let\@kernel@before@shipout@background\@empty
162 \let\@kernel@after@shipout@background\@empty

```

(End of definition for `\@kernel@after@shipout@lastpage`, `\@kernel@before@shipout@background`, and `\@kernel@after@shipout@background`.)

```

\_shipout_run_firstpage_hook: There are three commands to handle the shipout/firstpage hook: \_shipout_run_
firstpage_hook:, \_shipout_add_firstpage_specials: and \_shipout_drop_
firstpage_specials:.

```

That hook is supposed to contain `\specials` and similar material to be placed at the very beginning of the output page and so it needs careful placing to avoid that anything else gets in front of it. And this means we have to wait with this until other hooks such as `shipout/background` have added their bits. It is also important that such `\specials` show up only on the very first page, so if this page gets saved before `\shipout` for later reuse, we have to make sure that they aren't in the saved version.

In addition the hook may also contain code to be executed “first”, e.g., visible from code in `shipout/background` and this conflicts with adding the `\specials` late.

Therefore the processing is split into different parts: `_shipout_run_firstpage_hook:` is done early and checks if there is any material in the hook.

```

163 \cs_new:Npn \_shipout_run_firstpage_hook: {
164   \hook_if_empty:nTF {shipout/firstpage}

```

If not then we define the other two commands to do nothing.

```

165   {
166     \cs_gset_eq:NN \_shipout_add_firstpage_specials: \prg_do_nothing:
167     \cs_gset_eq:NN \_shipout_drop_firstpage_specials: \prg_do_nothing:
168   }

```

If there is material we execute inside a box, which means any `\special` will end up in that box and any other code is executed and can have side effects (as long as they are global).

```

169   {
170     \hbox_set:Nn \l__shipout_firstpage_box { \UseHook{shipout/firstpage} }
171   }

```

Once we are here we change the definition to do nothing next time and we also change the command used to implement `\AtBeginDvi` to become a warning and not add further material to a hook that is never used again.

```

172 \cs_gset_eq:NN \__shipout_run_firstpage_hook: \prg_do_nothing:
173 \cs_gset:Npn \__shipout_add_firstpage_material:Nn ##1 ##2 {
174   \@latex@warning{ First~ page~ is~ already~ shipped~ out,~ ignoring
175                 \MessageBreak \string##1 }
176 }
177 }

```

(End of definition for `__shipout_run_firstpage_hook:`.)

`__shipout_add_firstpage_specials:` The `__shipout_add_firstpage_specials:` then adds the `\specials` stored in `\l__shipout_firstpage_box` to the page to be shipped out when the time is ready. Note that if there was no material in the `shipout/firstpage` hook then this command gets redefined to do nothing. But for most documents there is something, e.g., some PostScript header, or some meta data declaration, etc. so by default we assume there is something to do.

```

178 \cs_new:Npn \__shipout_add_firstpage_specials: {

```

First we make a copy of the `\l_shipout_box` that we can restore it later on.

```

179 \box_set_eq:NN \l__shipout_raw_box \l_shipout_box

```

Adding something to the beginning means adding it to the background as that layer is done first in the output.

```

180 \__shipout_add_background_box:n { \hbox_unpack_drop:N \l__shipout_firstpage_box }

```

After the actual shipout `__shipout_drop_firstpage_specials:` is run to restore the earlier content of `\l_shipout_box` and then redefines itself again to do nothing.

As a final act we change the definition to do nothing next time.

```

181 \cs_gset_eq:NN \__shipout_add_firstpage_specials: \prg_do_nothing:
182 }

```

The `__shipout_drop_firstpage_specials:` is run after the shipout has occurred but before the `shipout/afterpage` hook is executed. That is the point where we have to restore the `\ShipoutBox` to its state without the `shipout/firstpage` material.

```

183 \cs_new:Npn \__shipout_drop_firstpage_specials: {
184   \box_set_eq:NN \l_shipout_box \l__shipout_raw_box

```

If there was no such material then `__shipout_run_firstpage_hook:` will have changed the definition to a no-op already. Otherwise this is what we do here.

```

185 \cs_gset_eq:NN \__shipout_drop_firstpage_specials: \prg_do_nothing:
186 }

```

(End of definition for `__shipout_add_firstpage_specials:` and `__shipout_drop_firstpage_specials:`.)

`\l__shipout_firstpage_box` The box to hold any firstpage `\specials`.

```

187 \box_new:N \l__shipout_firstpage_box

```

(End of definition for `\l__shipout_firstpage_box`.)

`\g__shipout_lastpage_handled_bool` A boolean to signal if we have already handled the `shipout/lastpage` hook.

```

188 \bool_new:N \g__shipout_lastpage_handled_bool

```

(End of definition for `\g__shipout_lastpage_handled_bool`.)

`_shipout_add_firstpage_material:Nn` This command adds material to the `shipout/firstpage` hook. It is used in `\AtBeginDvi`, etc. The first argument is the command through which it is called. Initially this is ignored but once we are passed the first page it can be used to generate a warning message mentioning the right user command.

```
189 \cs_new:Npn \_shipout_add_firstpage_material:Nn #1#2 {
190   \AddToHook{shipout/firstpage}{#2}
191 }
```

(End of definition for `_shipout_add_firstpage_material:Nn`.)

`_shipout_get_box_size:N` Store the box dimensions in dimen registers.

Todo: This could/should perhaps be generalized to set height depth and width given an arbitrary box.

```
192 \cs_new:Npn \_shipout_get_box_size:N #1 {
193   \dim_set:Nn \l_shipout_box_ht_dim { \box_ht:N #1 }
194   \dim_set:Nn \l_shipout_box_dp_dim { \box_dp:N #1 }
195   \dim_set:Nn \l_shipout_box_wd_dim { \box_wd:N #1 }
196   \dim_set:Nn \l_shipout_box_ht_plus_dp_dim
197     { \l_shipout_box_ht_dim + \l_shipout_box_dp_dim }
198 }
```

(End of definition for `_shipout_get_box_size:N`.)

`\l_shipout_box_ht_dim` And here are the variables set by `_shipout_get_box_size:N`.

`\l_shipout_box_dp_dim` 199 `\dim_new:N \l_shipout_box_ht_dim`

`\l_shipout_box_wd_dim` 200 `\dim_new:N \l_shipout_box_dp_dim`

`\l_shipout_box_ht_plus_dp_dim` 201 `\dim_new:N \l_shipout_box_wd_dim`

202 `\dim_new:N \l_shipout_box_ht_plus_dp_dim`

(End of definition for `\l_shipout_box_ht_dim` and others. These functions are documented on page 988.)

`\g_shipout_discard_bool` Indicate whether or not the current page box should be discarded

```
203 \bool_new:N \g_shipout_discard_bool
```

(End of definition for `\g_shipout_discard_bool`.)

`\l_shipout_tmp_box` We need a box for the background and foreground material and a token register to
`\l_shipout_saved_badness_tl` remember badness settings as we disable them during the buildup below.

```
204 \box_new:N \l_shipout_tmp_box
205 \tl_new:N \l_shipout_saved_badness_tl
```

(End of definition for `\l_shipout_tmp_box` and `\l_shipout_saved_badness_tl`.)

`_shipout_add_background_box:n` In standard L^AT_EX the shipout box is always a `\vbox` but here we allow for other usage as well, in case some package has its own output routine.

```
206 \cs_new:Npn \_shipout_add_background_box:n #1
207 { \_shipout_get_box_size:N \l_shipout_box
```

But we start testing for a vertical box as that should be the normal case.

```
208   \box_if_vertical:NTF \l_shipout_box
209   {
```

Save current values of `\vfuzz` and `\vbadness` then change them to allow box manipulations without warnings.

```

210      \tl_set:Nx \l__shipout_saved_badness_tl
211      { \vfuzz=\the\vfuzz\relax
212        \vbadness=\the\vbadness\relax }
213      \vfuzz=\c_max_dim
214      \vbadness=\c_max_int

```

Then we reconstruct `\l_shipout_box` ...

```

215      \vbox_set_to_ht:Nnn \l_shipout_box \l_shipout_box_ht_plus_dp_dim
216      {

```

... the material in #1 is placed into a horizontal box with zero dimensions.

```

217          \hbox_set:Nn \l__shipout_tmp_box
218          { \l__shipout_saved_badness_tl #1 }
219          \box_set_wd:Nn \l__shipout_tmp_box \c_zero_dim
220          \box_set_ht:Nn \l__shipout_tmp_box \c_zero_dim
221          \box_set_dp:Nn \l__shipout_tmp_box \c_zero_dim

```

The we typeset that box followed by whatever was in `\l_shipout_box` before (unpacked).

```

222          \skip_zero:N \baselineskip
223          \skip_zero:N \lineskip
224          \skip_zero:N \lineskiplimit
225          \box_use:N \l__shipout_tmp_box
226          \vbox_unpack:N \l_shipout_box

```

The `\kern` ensures that the box has no depth which is afterwards explicitly corrected.

```

227          \kern \c_zero_dim
228      }
229      \box_set_ht:Nn \l_shipout_box \l_shipout_box_ht_dim
230      \box_set_dp:Nn \l_shipout_box \l_shipout_box_dp_dim

```

Todo: The whole boxing maneuver looks a bit like overkill to me, but for the moment I leave.

```

231      \l__shipout_saved_badness_tl
232    }
233    {

```

A horizontal box is handled in a similar way. The last case would be a void box in which case we do nothing hence the missing F branch.

```

234      \box_if_horizontal:NT \l_shipout_box
235      {
236          \tl_set:Nx \l__shipout_saved_badness_tl
237          { \hfuzz=\the\hfuzz\relax
238            \hbadness=\the\hbadness\relax }
239          \hfuzz=\c_max_dim
240          \hbadness=\c_max_int
241          \hbox_set_to_wd:Nnn \l_shipout_box \l_shipout_box_wd_dim
242          {
243              \hbox_set:Nn \l__shipout_tmp_box
244              { \l__shipout_saved_badness_tl #1 }
245              \box_set_wd:Nn \l__shipout_tmp_box \c_zero_dim
246              \box_set_ht:Nn \l__shipout_tmp_box \c_zero_dim
247              \box_set_dp:Nn \l__shipout_tmp_box \c_zero_dim

```

```

248         \box_move_up:nn
249         \l_shipout_box_ht_dim
250         { \box_use:N \l__shipout_tmp_box }
251         \hbox_unpack:N \l_shipout_box
252     }
253     \l__shipout_saved_badness_tl
254 }
255 }
256 }

```

(End of definition for __shipout_add_background_box:n.)

__shipout_add_foreground_box:n Foreground boxes are done in the same way, only the order and placement of boxes has to be done differently.

```

257 \cs_new:Npn \__shipout_add_foreground_box:n #1
258 {
259     \box_if_vertical:NTF \l_shipout_box
260     {

305     }%
306     \l__shipout_saved_badness_tl
307 }
308 }
309 }

```

(End of definition for `__shipout_add_foreground_box:n`.)

`__shipout_init_page_origins:` Two constants holding the offset of the top-left with respect to the media box.
`\c__shipout_horigin_tl` Setting the constants this way is courtesy of Bruno.
`\c__shipout_vorigin_tl` We delay setting the constants to the last possible place as there might be updates in the preamble or even in the `begindocument` hook that affects their setup.

```

310 \cs_new:Npn \__shipout_init_page_origins: {
311   \tl_const:Nx \c__shipout_horigin_tl
312   {
313     \cs_if_exist_use:NTF \pdfvariable { horigin }
314     { \cs_if_exist_use:NF \pdfhorigin { 1in } }
315   }
316   \tl_const:Nx \c__shipout_vorigin_tl
317   {
318     \cs_if_exist_use:NTF \pdfvariable { vorigin }
319     { \cs_if_exist_use:NF \pdfvorigin { 1in } }
320   }

```

After the constants have been set there is no need to execute this command again, in fact it would raise an error, so we redefine it to do nothing.

```

321   \cs_gset_eq:NN \__shipout_init_page_origins: \prg_do_nothing:
322 }

```

(End of definition for `__shipout_init_page_origins:`, `\c__shipout_horigin_tl`, and `\c__shipout_vorigin_tl`.)

`__shipout_picture_overlay:n` Put the argument into a `picture` environment that doesn't take up any size and uses `1pt` for `\unitlength`.

Todo: Could perhaps be generalized as it might be useful elsewhere. For now it is not.

```

323 \cs_new:Npn \__shipout_picture_overlay:n #1 {

```

The very first time this is executed we have to initialize (and freeze) the origins.

```

324   \__shipout_init_page_origins:
325   \kern -\c__shipout_horigin_tl \scan_stop:
326   \vbox_to_zero:n {
327     \kern -\c__shipout_vorigin_tl \scan_stop:
328     \unitlength 1pt \scan_stop:

```

This mimics a simple zero-sized picture environment. The `\hss` is need in case there is horizontal material (without using `\put` with a positive width).

```

329     \hbox_set_to_wd:Nnn \l__shipout_tmp_box \c_zero_dim
330                     { \ignorespaces #1 \hss }
331     \box_set_ht:Nn \l__shipout_tmp_box \c_zero_dim
332     \box_set_dp:Nn \l__shipout_tmp_box \c_zero_dim
333     \box_use:N \l__shipout_tmp_box
334     \tex_vss:D
335   }
336 }

```

(End of definition for `__shipout_picture_overlay:n`.)

`__shipout_add_background_picture:n` Put a `picture` env in the background of the shipout box with its reference point in the top-left corner.

```

337 \cs_new:Npn \__shipout_add_background_picture:n #1 {
338   \__shipout_add_background_box:n { \__shipout_picture_overlay:n {#1} }
339 }

```

(End of definition for `__shipout_add_background_picture:n`.)

`__shipout_add_foreground_picture:n` Put a `picture` env in the foreground of the shipout box with its reference point in the top-left corner.

```

340 \cs_new:Npn \__shipout_add_foreground_picture:n #1 {
341   \__shipout_add_foreground_box:n { \__shipout_picture_overlay:n {#1} }
342 }

```

(End of definition for `__shipout_add_foreground_picture:n`.)

`\shipout_discard:` Request that the next shipout box should be discarded. At the moment this is just setting a boolean, but we may want to augment this behavior that the position of the call is taken into account (in case \LaTeX looks ahead and is not using the position for on the next page).

```

343 \cs_new_protected:Npn \shipout_discard: {
344   \bool_gset_true:N \g__shipout_discard_bool
345 }

```

(End of definition for `\shipout_discard:`. This function is documented on page 991.)

3.2 Handling the end of job hook

At the moment this is partly solved by using the existing hooks. But rather than putting the code into these hooks it should be moved to the right place directly as we shouldn't prefill hooks with material unless it needs to interact with other code.

`\g_shipout_readonly_int` We count every shipout activity that makes a page (but not those that are discarded) in order to know how many pages got produced.

`\ReadonlyShipoutCounter`

```

346 \int_new:N \g_shipout_readonly_int

```

For \LaTeX 2_ϵ it is available as a command (i.e., a \TeX counter only).

```

347 \cs_new_eq:NN \ReadonlyShipoutCounter \g_shipout_readonly_int

```

(End of definition for `\g_shipout_readonly_int` and `\ReadonlyShipoutCounter`. These functions are documented on page 992.)

`\g_shipout_totalpages_int` We count every shipout attempt (even those that are discarded) in this counter. It is not used in the code but may get used in user code.

```
348 \int_new:N \g_shipout_totalpages_int
```

For L^AT_EX 2_ε this is offered as a L^AT_EX counter so can be easily typeset inside the output routine to display things like “\thepage/\thetotalpages”, etc.

```
349 \cs_new_eq:NN \c@totalpages \g_shipout_totalpages_int
```

```
350 \cs_new:Npn \thetotalpages { \arabic{totalpages} }
```

(End of definition for `\g_shipout_totalpages_int` and `\c@totalpages`. These functions are documented on page 992.)

`\@abspage@last` In `\@abspage@last` record the number of pages from the last run. This is written to the .aux and this way made available to the next run. In case there is no .aux file or the statement is missing from it we initialize it with the largest possible number in T_EX. We use this as the default because then we are inserting the `shipout/lastpage` on the last page (or after the last page) but not on page 1 for a multipage document.

```
351 \xdef\@abspage@last{\number\maxdimen}
```

(End of definition for `\@abspage@last`.)

`\enddocument` Instead of using the hooks `enddocument` and `enddocument/afterlastpage` we add this code to private kernel hooks to be 100% sure when it is executed and to avoid cluttering the hooks with data that is always there.

Inside `\enddocument` there is a `\clearpage`. Just before that we execute this code here. There is a good chance that we are on the last page. Therefore, if we don’t know the value from the last run, we assume that the current page is the right one. So we set `\@abspage@last` and as a result the next shipout will run the `shipout/lastpage` code. Of course, if there are floats that still need a placement this guess will be wrong but then rerunning the document will give us the correct value next time around.

```
\@kernel@after@enddocument 352 \g@addto@macro \@kernel@after@enddocument {
353   \int_compare:nNnT \@abspage@last = \maxdimen
354   {
```

We use L^AT_EX 2_ε coding as `\@abspage@last` is not an L3 name.

```
355   \xdef\@abspage@last{ \int_eval:n {\g_shipout_readonly_int + 1} }
356   }
357 }
```

`\@kernel@after@enddocument@afterlastpage` Once the `\clearpage` has done its work inside `\enddocument` we know for sure how many pages this document has, so we record that in the .aux file for the next run.

```
358 \g@addto@macro \@kernel@after@enddocument@afterlastpage {
```

There is one special case: If no output is produced then there is no point in a) recording the number as 0 will never match the page number of a real page and b) adding an extra page to run the `shipout/lastpage` is pointless as well (as it would remain forever). So we test for this and run the code only if there have been pages.

```
359   \int_compare:nNnF \g_shipout_readonly_int = 0
360   {
```

This ends up in the .aux so we use L^AT_EX 2_ε names here.

Todo: This needs an interface for \nofiles in expl3, doesn't at the moment!

```

361     \if@filesw
362         \iow_now:Nx \@auxout {
363             \gdef\string\@abspage@last {\int_use:N \g_shipout_readonly_int}}
364     \fi

```

But we may have guessed wrongly earlier and have run it too early or we still have to run the `shipout/lastpage` even though there is no page to place it into. If that is the case we make a trivial extra page and put it there. This temporary page will then vanish again on the next run but helps to keep pdf viewers happy. In either case we should put out an appropriate “rerun” warning.

```

365     \bool_if:NTF \g__shipout_lastpage_handled_bool
366     {

```

If the hook was already executed, we have to test if that total shipouts match the shipouts from last run (because that corresponds to the page it was executed). If not we output a warning.

```

367         \int_compare:nNnF \@abspage@last = \g_shipout_readonly_int
368         {
369             \@latex@warning@no@line{Hook~ 'shipout/lastpage'~ executed~
370             on~ wrong~ page~ (\@abspage@last\space not~
371             \int_use:N\g_shipout_readonly_int).\MessageBreak
372             Rerun~ to~ correct~ this}%
373         }
374     }
375     {

```

If the hook was not run, we need to add an extra page and place it there. However, making this extra page in case the hook is actually empty would be forcing a rerun without any reason, so we check that condition and also check if `\@kernel@after@shipout@lastpage` contains any code. If both are empty we omit the page generation.

```

376         \bool_lazy_and:nnF
377         { \hook_if_empty_p:n {shipout/lastpage} }
378         { \tl_if_empty_p:N \@kernel@after@shipout@lastpage }
379         {
380             \tex_shipout:D\ vbox to\textheight
381             {
382                 \hbox:n { \UseHook{shipout/lastpage}
383                     \@kernel@after@shipout@lastpage }

```

This extra page could be totally empty except for the hook content, but to help the user understanding why it is there we put some text into it.

```

384             \__shipout_excuse_extra_page:
385             \null
386         }

```

At this point we also signal to L^AT_EX's endgame that a rerun is necessary so that an appropriate message can be shown on the terminal. We do this by simply defining a command used as a flag and tested in `\enddocument`.

```

387         \cs_gset_eq:NN \@extra@page@added \relax
388     }
389 }
390 }
391 }

```

(End of definition for `\enddocument`, `\@kernel@after@enddocument`, and
`\@kernel@after@enddocument@afterlastpage`.)

`_shipout_excuse_extra_page:` Say mea culpa ...

```

392 \cs_new:Npn \_shipout_excuse_extra_page: {
393   \vfil
394   \begin{center}
395     \bfseries Temporary~ page!
396   \end{center}
397   \LaTeX{}~ was~ unable~ to~ guess~ the~ total~ number~ of~ pages~
398   correctly.~ ~ As~ there~ was~ some~ unprocessed~ data~ that~
399   should~ have~ been~ added~ to~ the~ final~ page~ this~ extra~
400   page~ has~ been~ added~ to~ receive~ it.
401   \par
402   If~ you~ rerun~ the~ document~ (without~ altering~ it)~ this~
403   surplus~ page~ will~ go~ away,~ because~ \LaTeX{}~ now~ knows~
404   how~ many~ pages~ to~ expect~ for~ this~ document.
405   \vfil
406 }
```

(End of definition for `_shipout_excuse_extra_page:`.)

`\PreviousTotalPages` In the preamble before the aux file was read `\PreviousTotalPages` is always zero.

`\@kernel@before@begindocument`

```

407 \def\PreviousTotalPages{0}
```

In the aux file there should be an update for `\@abspage@last` recording the number of pages from the previous run. If not that macro holds the value of `\maxdimen`. So we test for it and update `\PreviousTotalPages` if there was a real value. This should happen just before the `begindocument` hook is executed so that the value can be used inside that hook.

```

408 \g@addto@macro\@kernel@before@begindocument
409   {\ifnum\@abspage@last<\maxdimen
410     \xdef\PreviousTotalPages{\@abspage@last}\fi}
```

(End of definition for `\PreviousTotalPages` and `\@kernel@before@begindocument`. These functions are documented on page 992.)

4 Legacy L^AT_EX 2_ε interfaces

`\DiscardShipoutBox` Request that the next shipout box is to be discarded.

```

411 \cs_new_eq:NN \DiscardShipoutBox \shipout_discard:
```

(End of definition for `\DiscardShipoutBox`. This function is documented on page 991.)

`\AtBeginDvi` If we roll forward from an earlier kernel `\AtBeginDvi` is defined so we better not use `\cs_new_protected:Npn` here.

```

412 \cs_set_protected:Npn \AtBeginDvi
413   {\_shipout_add_firstpage_material:Nn \AtBeginDvi}
```

(End of definition for `\AtBeginDvi`. This function is documented on page 990.)

`\DebugShipoutsOn`

`\DebugShipoutsOff`

```

414 \cs_new_eq:NN \DebugShipoutsOn \shipout_debug_on:
415 \cs_new_eq:NN \DebugShipoutsOff \shipout_debug_off:
```

(End of definition for `\DebugShipoutsOn` and `\DebugShipoutsOff`. These functions are documented on page 992.)

5 Internal commands needed elsewhere

These internal commands use double and triple @ signs so we need to stop getting them translated to the module name.

506 \@expl@@@shipout@add@background@picture@@n
507 \let \AtBeginShipoutUpperLeftForeground
508 \@expl@@@shipout@add@foreground@picture@@n

```

(End of definition for `\AtBeginShipoutAddToBox` and others. These functions are documented on page 993.)

`\AtBeginShipoutOriginalShipout` This offers the raw `\shipout` primitive of the engine. A page shipped out with this is not counted by `\ReadonlyShipoutCounter` counter and thus the mechanism to place `\specials` at the very end of the output might fail, etc. It should therefore not be used in new applications but is only provided to allow running legacy code. For new code use the commands provided by the kernel instead.

```
509 \ExplSyntaxOn
510 \cs_new_eq:NN \AtBeginShipoutOriginalShipout \tex_shipout:D
```

(End of definition for `\AtBeginShipoutOriginalShipout`. This function is documented on page 993.)

`\ShipoutBoxHeight` `\ShipoutBoxWidth` `\ShipoutBoxDepth` This is somewhat different from the original in `atbegshi` where `\ShipoutBoxHeight` etc. only holds the `\the\ht<box>` value. This may have some implications in some use cases and if that is a problem then it might need changing.

```
511 \cs_new:Npn \ShipoutBoxHeight { \dim_use:N \l_shipout_box_ht_dim }
512 \cs_new:Npn \ShipoutBoxDepth { \dim_use:N \l_shipout_box_dp_dim }
513 \cs_new:Npn \ShipoutBoxWidth { \dim_use:N \l_shipout_box_wd_dim }
514 \ExplSyntaxOff
```

(End of definition for `\ShipoutBoxHeight`, `\ShipoutBoxWidth`, and `\ShipoutBoxDepth`.)

```
515 </atbegshi-ltx>
```

If the package is requested we substitute the one above:

```
516 <*2ekernel>
517 \declare@file@substitution{atbegshi.sty}{atbegshi-ltx.sty}
518 </2ekernel>
```

6.3 Package **everyshi** emulation

This is now directly handled in that package so emulation is not necessary any more.

Rather important :-)

```
519 <@@=>
```

File aa

ltoutput.dtx

1 Output Routine

1.1 Floats

The ‘2ekernel’ code ensures that a `\usepackage{autoout1}` is essentially ignored if a ‘full’ format is being used that has the autoload file mode already in the format.

```

PAGE LAYOUT PARAMETERS

`\topmargin` : Extra space added to top of page.
`@twoside` : boolean. T if two-sided printing
`\oddsidemargin` : IF @twoside = T
THEN extra space added to left of odd-numbered
pages.
ELSE extra space added to left of all pages.
`\evensidemargin` : IF @twoside = T
THEN extra space added to left of even-numbered
pages.
`\headheight` : height of head
`\headsep` : separation between head and text
`\footskip` : distance separation between baseline of last
line of text and baseline of foot.
Note difference between `\footSKIP` and `\headSEP`.
`\textheight` : height of text on page, excluding head and foot
`\textwidth` : width of printing on page
`\columnsep` : IF @twocolumn = T
THEN width of space between columns
`\columnseprule` : IF @twocolumn = T
THEN width of rule between columns (0 if none).
`\columnwidth` : IF @twocolumn = T
THEN $(\text{\textwidth} - \text{\columnsep})/2$
ELSE `\textwidth`
It is set by the `\twocolumn` and
`\onecolumn` commands.

`\@textbottom` : Command executed at bottom of vbox holding text of page (including figures). The `\raggedbottom` command almost `\let's` this to `\vfil` (actually sets it to `\vskip \z@ plus.0001fil`). Should have depth 0pt.

`\@texttop` : Command executed at top of vbox holding text of page (including figures). Used by letter style; can also be used to produce centered pages. Let to `\relax` by `\raggedbottom` and `\flushbottom`.

Page layout must initialize `\@colht` and `\@colroom` to `\textheight`.

PAGE STYLE PARAMETERS:

`\floatsep` : Space left between floats.

`\textfloatsep` : Space between last top float or first bottom float and the text.

`\topfigrule` : Command to place rule (or whatever) between floats at top of page and text. Executed in inner vertical mode right before the `\textfloatsep` skip separating the floats from the text. Must occupy zero vertical space. (See `\footnoterule`.)

`\botfigrule` : Same as `\topfigrule`, but put after the `\textfloatsep` skip separating text from the floats at bottom of page.

`\intextsep` : Space left on top and bottom of an in-text float.

`\dblfloatsep` : Space between double-column floats.

`\dbltextfloatsep` : Space between top double-column floats and text.

`\dblfigrule` : Similar to `\topfigrule`, but for double-column floats.

`\@fptop` : Glue to go at top of float column – must be 0pt + stretch

`\@fpsep` : Glue to go between floats in a float column.

`\@fpbot` : Glue to go at bottom of float column
– must be 0pt + stretch

`\@dblfpptop`, `\@dblfpsep`, `\@dblfpbot`
: Analogous for double-column float page in two-column format.

FOOTNOTES: As in PLAIN, footnotes use `\insert\footins`.

PAGE LAYOUT SWITCHES AND MACROS

`@twocolumn` : Boolean. T if two columns per page globally.

PAGE STYLE MACROS AND SWITCHES

```

\@oddhead      : IF @twoside = T
                  THEN macro to generate head of odd-numbered

                  THEN macro to generate foot of even-numbered
                  pages.
@specialpage   : boolean. T if current page is to have a special
                  format.
\@specialstyle : If its value is foo then
                  IF @specialpage = T
                  THEN the command \ps@foo is executed to
                  temporarily reset the page style parameters
                  before composing the current page.
                  This command should execute only \def's and
                  \edef's, making only local definitions.

```

FLOAT PLACEMENT PARAMETERS

The following parameters are set by the macro `\@floatplacement`.
When `\@floatplacement` is called,

`\@colht` is the height of the page or column being built. I.e.:

- * For single-column page it equals `\textheight`.
- * For double-column page it equals `\textheight - height`
of double-column floats on page.

Note that some are set globally and some locally:

```

\@topnum      :=G Maximum number of floats allowed on the top of a
                  column.
\@toproom     :=G Maximum amount of top of column devoted to floats—
                  excluding \textfloatsep separation below the floats
                  and \floatsep separation between them. For
                  two-column output, should be computed as a function
                  of \@colht.
\@botnum, \@botroom
              : Analogous to above.
\@colnum      :=G Maximum number of floats allowed in a column,
                  including in-text floats.
\@textmin     :=L Minimum amount of text (excluding footnotes) that
                  must appear on a text page.
                %% 27 Sep 85 : made local to
                %% \@addtocurcol and \@addtonextcol
                It is now also used locally in processing double
                floats.

```

`\@fpmin` :=L Minimum height of floats in a float column.

The macro `\@dblfloatplacement` sets the following parameters.

`\@dbltopnum` :=G Maximum number of double-column floats allowed at the top of a two-column page.

`\@dbltoproom` :=G Maximum height of double-column floats allowed at top of two-column page.

`\@fpmin` :=L Minimum height of floats in a float column.

It should also perform the following local assignments where necessary – i.e., where the new value differs from the old one:

`\@fptop` :=L `\@dblfpptop`

`\@fpsep` :=L `\@dblfpsep`

`\@fpbot` :=L `\@dblfpbot`

OUTPUT ROUTINE VARIABLES

`\@colht` : The total height of the current column. In single column style, it equals `\textheight`. In two-column style, it is `\textheight` minus the height of the double-column floats on the current page. MUST BE INITIALIZED TO `\textheight`.

`\@colroom` : The height available in the current column for text and footnotes. It equals `\@colht` minus the height of all floats committed to the top and bottom of the current column.

`\@textfloatsheight` : The total height of in-text floats on the current page.

`\footins` : Footnote insertion number.

`\@maxdepth` : Saved value of TeX's `\maxdepth`. Must be set when any routine sets `\maxdepth`.

CALLING THE OUTPUT ROUTINE

The output routine is called either by TeX's normal page-breaking mechanism, or by a macro putting a penalty $<$ or $= -10000$ in the output list. In the latter case, the penalty indicates why the output routine was called, using the following code.

| penalty | reason |
|---------|---|
| -10000 | <code>\pagebreak</code> <code>\newpage</code> |
| -10001 | <code>\clearpage</code> (<code>\penalty -10000 \vbox{}</code> <code>\penalty -10001</code>) |
| -10002 | float insertion, called from horizontal mode |
| -10003 | float insertion, called from vertical mode. |
| -10004 | float insertion. |

Note: A float or marginpar puts the following sequence in the output list:

- (i) a penalty of -10004,
- (ii) a null `\vbox`
- (iii) a penalty of -10002 or -10003.

This solves two special problems:

1. If the float comes right after a `\newpage` or `\clearpage`, then the first penalty is ignored, but the second one invokes the output routine.
2. If there is a split footnote on the page, the second 'page' puts out the rest of the footnote.

THE OUTPUT ROUTINE

FUNCTIONS USED IN THE OUTPUT ROUTINE:

`\@outputpage` : Produces an output page with the contents of box `\@outputbox` as the text part.

Also sets `\@colht :=G \textheight`.

The page style is determined as follows.

IF `@thispagestyle = true`

THEN use `\thispagestyle` style

ELSE use ordinary page style.

`\@tryfcolumn\FLIST` : Tries to form a float column composed of floats from `\FLIST` (if nonempty) with the following parameters:

`\@colht` : height of box

`\@fpmin` : minimum height of floats in the box

`\@fpsep` : interfloat space

`\@fptop` : glue at top of box

`\@fpbot` : glue at bottom of box.

If it succeeds, then it does the following:

* `\@outputbox :=L` the composed float box.

* `@fcolmade :=G true`

* `\FLIST :=G \FLIST` - floats put in box

* `\@freelist :=G \@freelist` + floats put in box

If it fails, then:

* `@fcolmade :=G false`

NOTE: BIT MUST BE A SINGLE TOKEN!

`\@makefcolumn \FLIST` : Same as `\@tryfcolumn` except that it fails to make a float column only if `\FLIST` is empty. Otherwise, it makes a float column containing at least the first box in `\FLIST`, disregarding `\@fpmin`.

`\@startcolumn` :

Calls `\@tryfcolumn\@deferlist`. If `\@tryfcolumn` returns with (globally set) `@fcolmade = false`, then:

* Globally sets `\@toplist` and `\@botlist` to floats

from `\@deferlist` to go at top and bottom of column, deleting them from `\@deferlist`. It does this using `\@colht` as the total height, the page style parameters `\@floatsep` and `\@textfloatsep`, and the float placement parameters `\@topnum`, `\@toproom`, `\@botnum`, `\@botroom`, `\@colnum` and `\textfraction`.

- * Globally sets `\@colroom` to `\@colht` minus the height of the added floats.

`\@startdblcolum` :

Calls `\@tryfcolum\@dbldeferlist{8}`. If `\@tryfcolum` returns with (globally set) `@fcolmade = false`, then:

- * Globally sets `\@dbltoplist` to floats from `\@dbldeferlist` to go at top and bottom of column, deleting them from `\@dbldeferlist`. It does this using `\textheight` as the total height, and the parameters `\@dblfloatsep`, etc.
- * Globally sets `\@colht` to `\textheight` minus the height of the added floats.

`\@combinefloats` : Combines the text from box

`\@outputbox` with the floats from `\@toplist` and `\@botlist`, putting the new box in `\@outputbox`. It uses `\floatsep` and `\textfloatsep` for the appropriate separations. It puts the elements of `\TOPLIST` and `\BOTLIST` onto `\freelist`, and makes those lists null.

`\@makecol` : Makes the contents of `\box255` plus the accumulated footnotes, plus the floats in `\@toplist` and `\@botlist`, into a single column of height `\@colht` (unless the page height has been locally changed), which it puts into box `\@outputbox`. It puts boxes in `\@midlist` back onto `\freelist` and restores `\maxdepth`.

`\@opcol` : Outputs a column whose text is in box `\@outputbox`

If `@twocolumn = false`, then it calls `\@outputpage`, sets `\@colht :=G \textheight`, and calls `\@floatplacement`.

If `@twocolumn = true`, then:

If `@firstcolumn = true`, then it puts box `\@outputbox` into `\@leftcolumn` and sets `@firstcolumn :=G false`.

If `@firstcolumn = false`, then it puts out the current two-column page, any possible two-column float pages, and determines `\@dbltoplist` for the next page.

USER COMMANDS THAT CALL OR AFFECT THE OUTPUT ROUTINE

```

\newpage == BEGIN \par\vfil\penalty -10000 END

\clearpage == BEGIN \newpage
                \write -1{}      % Part of hack to make sure no
                \vbox{}          % \write's get lost.
                \penalty -10001
            END

\cleardoublepage == BEGIN \clearpage
                        if @twoside = true and c@page is even
                        then \hbox{} \newpage fi
            END

\twocolumn[BOX] : starts a new page, changing to twocolumn setting
                  and puts BOX in a parbox of width \textwidth across the top.
                  Useful for full-width titles for double-column pages.
                  SURPRISE: The stretch from \@dbltextfloatsep will be inserted
                           between the BOX and the top of the two columns.

```

FLOAT-HANDLING MECHANISMS

The float environment obtains an insertion number B from the `\@freelist` (see below for a description of list manipulation), puts the float into box B and sets `\count B` to a FLOAT SPECIFIER. For a normal (not double-column) float, it then causes a page break in one of the following two ways:

- In outer hmode: `\vadjust{\penalty -10002}`
- In vmode : `\penalty -10003`.

For a double-column float, it puts B onto the `\@dbldeferlist`.

The float specifier has two components:

- * A PLACEMENT SPECIFICATION, describing where the float may be placed.
- * A TYPE, which is a power of two—e.g., figures might be type 1 floats, tables type 2 floats, programs type 4 floats, etc.

The float specifier is encoded as follows, where bit 0 is the least significant bit.

| Bit | Meaning |
|-----|--|
| 0 | 1 iff the float may go where it appears in the text. |
| 1 | 1 iff the float may go on the top of a page. |
| 2 | 1 iff the float may go on the bottom of a page. |
| 3 | 1 iff the float may go on a float page. |
| 4 | 1 unless the PLACEMENT includes a ! |
| 5 | 1 iff a type 1 float |

6 1 iff a type 2 float
etc.

A negative float specifier is used to indicate a marginal note.

MACROS AND DATA STRUCTURES FOR PROCESSING FLOATS

A FLOAT LIST consisting of the floats in boxes `\boxa ... \boxN` has the form:

```
\@elt \boxa ... \@elt \boxN
where \boxI is defined by
\newinsert\boxI
```

Normally, `\@elt` is `\let` to `\relax`. A test can be performed on the entire float list by locally `\def`'ing `\@elt` appropriately and executing the list.

This is a lot more efficient than looping through the list.

The following macros are used for manipulating float lists.

```
\@next \CS \LIST {NONEMPTY}{EMPTY} == %% NOTE: ASSUME \@elt
= \relax
  BEGIN  assume that \LIST == \@elt \B1 ... \@elt \Bn
        if n = 0
        then  EMPTY
        else  \CS      :=L \B1
              \LIST :=G \@elt \B2 ... \@elt \Bn
              NONEMPTY
        fi
  END
```

`\@bitor\NUM\LIST` : Globally sets switch `@test` to the disjunction for all `I` of bit `log2 \NUM` of the float specifiers of all the floats in `\LIST`.
I.e., `@test` is set to true iff there is at least one float in `\LIST` having bit `log2 \NUM` of its float specifier equal to 1.

Note: `log2 [(\count I)/32]` is the bit number corresponding to the type of float `I`. To see if there is any float in `\LIST` having the same type as float `I`, you run `\@bitor` with
`\NUM = [(\count I)/32] * 32`.

```
\@bitor\NUM\LIST ==
BEGIN
  @test :=G false
  { \@elt \CTR == if \NUM <> 0 then
                    if \count\CTR / \NUM is odd
                    then  @test := true          fi fi
```

```

\LIST
}
END

```

`\@cons\LIST\NUM` : Globally sets `\LIST := \LIST * \@elt \NUM`

```

\@cons\LIST\NUM ==
  BEGIN { \@elt == \relax
    \LIST :=G \LIST \@elt \NUM
  }

```

BOX LISTS FOR FLOAT-PLACEMENT ALGORITHMS

```

\@freelist      : List of empty boxes for placing new floats.
\@toplist       : List of floats to go at top of current column.
\@midlist       : List of floats in middle of current column.
\@botlist       : List of floats to go at bottom of current column.
\@deferlist     : List of floats to go after current column.
\@dbltoplist    : List of double-col. floats to go at top of current
                  page.
\@dbldeferlist  : List of double-column floats to go on subsequent
                  pages.

```

FLOAT-PLACEMENT ALGORITHMS

```

\@addtobot : Tries to put insert \@currbox on \@botlist.
             Called only when:
               * \ht BOX < \@colroom
               * type of \@currbox not on \@deferlist
               * \@colnum > 0
               * @insert = false
             If it succeeds, then:
               * sets @insert true
               * decrements \@botroom by \ht BOX
               * decrements \@botnum and \@colnum by 1
               * decrements \@colroom by \ht BOX + either \floatsep
                 or \textfloatsep, as appropriate.
               * sets \maxdepth to 0pt

\@addtotoporbot : Tries to put insert \@currbox on \@toplist or
                  \@botlist.
                  Called only under same conditions as \@addtobot.
                  If it succeeds, then:
                    * sets @insert true
                    * decrements \@toproom or \@botroom by \ht BOX
                    * decrements \@colnum and either \@topnum or
                      \@botnum by 1
                    * decrements \@colroom by \ht BOX + \floatsep

```

or `\textfloatsep`, as appropriate.

`\@addtocurcol` : Tries to add `\@currbox` to current column, setting
 `@insert` true if it succeeds, false otherwise.
 It will add `\@currbox` to top only if bit 0 of
 `\count \@currbox` is 0, and to the bottom only if
 bit 0 = 0 or an earlier float of the same type is
 put on the bottom.
 If the float is put in the text, then
 `\penalty\interlinepenalty` is put
 right after the float, before the following `\vskip`,
 and `\outputpenalty :=L 0`.

`\@addtonextcol` : Tries to add `\@currbox` to the next column, setting
 `@insert` true if it succeeds, false otherwise.

`\@addtodblcol` : Tries to add `\@currbox` to the next double-column page,
 adding it to `\@dbltoplist` if it succeeds and
 `\@dbldeferlist` if it fails.

```
\@addmarginpar ==
BEGIN
  if \@currlist nonempty
    then remove \@marbox from \@currlist
      add \@marbox and \@currbox to \@freelist
      %% NOTE: \@currbox = left box
    else LaTeX error: ? %% shouldn't happen
  fi
  \@tempcnta := 1      %% 1 = right, -1 = left
  if @twocolumn = true
    then if @firstcolumn = true
      then \@tempcnta := -1
    fi
    else if @mparswitch = true
      then if count0 odd
        else \@tempcnta := -1
      fi
    fi
    if @reversemargin = true
      then \@tempcnta := -\@tempcnta
    fi
  fi
  if \@tempcnta < 0 then \box\@marbox :=G \box\@currbox
  fi
  \@tempdima :=L maximum(\@mparbottom - \@pageht
                        + ht of \@marbox, 0)
  if \@tempdima > 0 then LaTeX warning: 'marginpar moved' fi
  \@mparbottom :=G \@pageht + \@tempdima + depth of \@marbox
                + \marginparpush
```

```

\@tempdima :=L \@tempdima - ht of \@marbox
\box\@marbox :=G \box\@currbox
\hbox{ \vbox { \vskip \@tempdima
\box\@marbox
}
height of \@marbox :=G depth of \@marbox :=G 0
\kern -\@pagedp
\nointerlineskip
\hbox{ if @tempcnta > 0 then \hskip \columnwidth
\hskip \marginparsep
else \hskip -\marginparsep
\hskip -\marginparwidth
fi
\box\@marbox \hss
}
\nobreak
\nointerlineskip
\hbox{\vrule height 0 width 0 depth \@pagedp}
END

```

Floats and marginpars add a lot of dead cycles.

```

\AtBeginDvi We use a box register in which to put stuff that must appear before anything else in the .dvi file.

The stuff in the box should not add any typeset material to the page when it is unboxed.

This interface is no longer used. Instead a new one is inside `ltshipout.dtx`. We only keep the box in case some old code refers to it directly (or we do some rollback).

```

86 \newbox\@begindvibox
87 %\DeclareRobustCommand \AtBeginDvi [1]{%
88 % \global \setbox \@begindvibox
89 % \vbox{\unvbox \@begindvibox #1}%
90 %}

```

(End of definition for \AtBeginDvi and \@begindvibox. These functions are documented on page 990.)

\@maxdepth This is not the right place to set this; it needs to be set in a class/style file when `\maxdepth` is set.

Also, many settings to `\maxdepth` should be to `\@maxdepth`, probably?

```

91 \newdimen\@maxdepth
92 \@maxdepth = \maxdepth

```

(End of definition for \@maxdepth.)

\paperheight New `\paper...` registers.

```

\paperwidth 93 \newdimen\paperheight
94 \newdimen\paperwidth

```

(End of definition for \paperheight and \paperwidth.)

\stockheight New `\stock...` registers.

```

\stockwidth 95 \newdimen\stockheight
96 \newdimen\stockwidth

```

(End of definition for \stockheight and \stockwidth.)

\if@insert Local switches first:

```

\if@fcolmade 97 \newif \if@insert

```

\if@specialpage These should definitely be global:

```

\if@firstcolumn 98 \newif \if@fcolmade
\if@twocolumn 99 \newif \if@specialpage \@specialpagefalse
\if@twoside

```

\if@reversemarginpar These should be global but are not always set globally in other files.

```

\if@mparswitch 100 \newif \if@firstcolumn \@firstcolumntrue
\col@number 101 \newif \if@twocolumn \@twocolumnfalse

```

Not sure about these: two questions. Should things which must apply to a whole document be local or global (they probably should be ‘preamble only’ commands)? Are these three such things?

```

102 \newif \if@twoside      \@twosidefalse
103 \newif \if@reversemargin \@reversemarginfalse
104 \newif \if@mparswitch  \@mparswitchfalse

```

This counter has been imported from ‘multicol’.

```

105 \newcount \col@number
106 \col@number \@one

```

(End of definition for \if@insert and others.)

(End of definition for \onecolumn.)

\newpage The two checks at the beginning ensure that an item label or run-in section title immediately before a **\newpage** get printed on the correct page, the one before the page break.

All three tests are largely to make error processing more robust; that is why they all reset the flags explicitly, even when it would appear that this would be done by a **\leavevmode**.

```

152 \endkernel | fltrace)
153 \latexrelease\IncludeInRelease{2017/04/15}%

168 \par

```

The **\vfil** at the end of the macro before the break penalty will normally result in the page being run short, even with **\flushbottom** in effect (in contrast to the behavior of **\pagebreak**). However, if there is some explicit stretch on the page, say, a **\vfill**, it has the undesired side-effect, that the last line will not align at its baseline if it contains characters going below the baseline, as the value of **\prevdepth** is no longer taken into

account by T_EX. So we back up by that amount (or by `\maxdepth` if it is really huge), to mimic the normal behavior without the `\newpage`.

```

`\@emptycol` It may be better to use an invisible rule rather than an empty box here.

```

200 \def \@emptycol {\vbox{}\penalty -\@M}

```

(End of definition for \@emptycol.)

`\twocolumn` There are several bug fixes to the two-column stuff here.
`\@topnewpage`

```

201 \def \twocolumn {%
202 \clearpage
203 \global\columnwidth\textwidth
204 \global\advance\columnwidth-\columnsep
205 \global\divide\columnwidth\tw@
206 \global\hsize\columnwidth
207 \global\linewidth\columnwidth
208 \global\@twocolumntrue
209 \global\@firstcolumntrue
210 \col@number \tw@

```

There is no reason to put a `\@dblfloatplacement` here since `\@topnewpage` ignores these settings. The `\@floatplacement` is needed in case this comes after some changes.

```
211 \ifnextchar [\@topnewpage\@floatplacement
212 }
```

Note that here, getting a box from the freelist can assume success since this comes just after a `\clearpage`.

```
213 \long\def \@topnewpage [#1]{%
214 \nodocument
215 \@next\@currbox\@freelist{}-{}%
216 \global \setbox\@currbox
217 \color@vbox
218 \normalcolor
219 \vbox {%
220 \hsize\textwidth
221 \@parboxrestore
222 \col@number \@ne
223 #1%
224 \vskip -\dbltextfloatsep
225 }%
226 \color@endbox
```

Added size test and warning message; perhaps we should use an error message.

```
227 \ifdim \ht\@currbox>\textheight
228 \ht\@currbox \textheight
229 \fi
```

This next line is not essential but it is more robust to make this value non-zero, in case of weird errors.

This next bit is what is needed from `\@addtodblcol`, plus some extra checks for error trapping.

```
230 \global \count\@currbox \tw@
231 \@tempdima -\ht\@currbox
232 \advance \@tempdima -\dbltextfloatsep
233 \global \advance \@colht \@tempdima
234 \ifx \@dbltoplist \@empty
235 \else
236 \latex@error{Float(s) lost}\@ehb
237 \let \@dbltoplist \@empty
238 \fi
239 \@cons \@dbltoplist \@currbox
```

This setting of `\@dbltopnum` is used only to change the typesetting in `\@combinedblfloats`.

```
240 \global \@dbltopnum \m@ne
241 (*trace)
242 \fl@trace{dbltopnum set to -1 (= \the \@dbltopnum) (topnewpage)}%
243 /trace)
```

At points such as this we need to check that there is still a minimal amount of room left on the page; this uses an arbitrary small value at present; but note that this value is larger than that used when checking that page is too full of normal floats.

If there is little room left we just force a page-break, OK? This involves producing two empty columns. The second empty column may be produced by `\output`, in which case an extra, misleading, warning will be generated, OK? (This happens only when there

is too little room left on the page for any float.) Otherwise (i.e. if the size is such that it is allowed as a normal float) the extra `\@emptycol` will be invoked in the second column by the conditional code guarded by the `\if@firstcolumn` test.

I now think that the cut-off point here should be `3\baselineskip`, but we make it a bit less so that 3 lines of text will be allowed, OK?

Since this happens only when there is nothing on the page but the ‘top-box’, the empty box should not cause any problem other than some overfull box messages, which is not entirely misleading.

Here we need two page-ends since both columns need to be empty.

```

244 \ifdim \@colht<2.5\baselineskip
245   \@latex@warning@no@line {Optional argument of \noexpand\twocolumn
246     too tall on page \thepage}%
247   \@emptycol
248   \if@firstcolumn
249   \else
250     \@emptycol
251   \fi
252 \else
253   \global \vsize \@colht
254   \global \@colroom \@colht
255   \@floatplacement
256 \fi
257 }
```

(End of definition for `\twocolumn` and `\topnewpage`.)

`\output` This needs some small adjustments. We cannot guarantee that the float mechanism will
`\@specialoutput` interact correctly with this stuff, but that mechanism does not always work properly with footnotes already.

RmS 91/09/29:

added reset of `\par` to the output routine. This avoids problems when the output routine is called within a list where `\par` may be a no-op.

```

258 \output {%
259   \let \par \@@par
260   \ifnum \outputpenalty<-\@M
261     \@specialoutput
262   \else
263     \@makecol
264     \@opcol
```

Moved to `\@opcol: \@floatplacement`.

```

265   \@startcolumn
```

This loop could be replaced by an `\expandafter` tail recursion in `\@startcolumn`.

```

266   \@whilesw \if@fcolmade \fi
267   {%
268   < *trace>
269     \fl@trace{PAGE: float \if@twocolumn column \else page \fi
270       completed}%
271   < /trace>
272     \@opcol\@startcolumn}%
273   \fi
274   \ifnum \outputpenalty>-\@Miv
```

At points such as this we need to check that there is still a minimal amount of room left on the page; this uses an arbitrary small value at present. If there is little room left we just force a page-break, OK?

This bit is essential only if a float has just been processed so maybe it should be moved; but this is the natural place at which to set the vsize and a test would need to be done anyway. A check has been added to ensure that there really has been a change in the value of \@colroom.

Since this happens only when there is nothing on the page but floats, the empty box should not cause any problem other than some overfull box messages, which is not entirely misleading.

The twocolumn case does not need any extra code here since this is the \output itself; in the second column there will still not be enough room left so \@emptycol will be executed again when the OR is called by the-page builder when it gets to the penalty inserted by the first execution. (The page-builder is never invoked whilst the OR is being executed since it builds a inner vlist; thus any conditional code for the two-column case within \output may not get executed with the correct value of \if@firstcolumn.

```

275 \ifdim \@colroom<1.5\baselineskip
276 \ifdim \@colroom<\textheight
277 \latex@warning@no@line {Text page \thepage\space
278 contains only floats}%
279 \@emptycol

292 \else
293 \global \vsize \maxdimen
294 \fi
295 }

```

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

CHANGES TO \@specialoutput:

* \penalty\z@ changed to \penalty\interlinepenalty so \samepage works properly with figure and table environments.

(Changed 23 Oct 86)

* Definition of \@specialoutput changed 26 Feb 88 so \@pageht and \@pagedp aren't changed for a marginal note.

(Change suggested by Chris Rowley.)

End of historical L^AT_EX 2.09 comments.

```

296 \gdef\@specialoutput{%
297 \ifnum \outputpenalty>-\@Mii
298 \doclearpage

```

```

299 \else
300 \ifnum \outputpenalty<-\@Miii
301 \ifnum \outputpenalty<-\@MM \deadcycles \z@ \fi
302 \global \setbox\@holdpg \vbox {\unvbox\@cclv}%
303 \else

```

Note that `\boxmaxdepth` should not be set here since we wish to record the natural depth of the holdpg box.

This is changed so as to not lose anything, such as writes and marks, which may get into box 255 and should be returned to the list. This should only happen when the first penalty in the mechanism is discarded and therefore `\@holdpg` should always be void in this case. This can happen because a penalty is discarded whenever there is no box on the list.

It was just: `\setbox\@tempboxa\box\@cclv`.

The last box which is removed is the box put there by the double-penalty mechanism. The `\unskip` then removes the `\topskip` which is put there since the box is the first on the page.

```

304 \global \setbox\@holdpg \vbox{%
305 \unvbox\@holdpg
306 \unvbox\@cclv

```

We must now remove the box added by the float mechanism and the `\topskip` glue therefore added above it by T_EX.

```

307 \setbox\@tempboxa \lastbox
308 \unskip
309 }%

```

These two are needed as separate dimensions only by `\@addmarginpar`; for other purposes we put the whole size into `\@pageht` (see below).

```

310 \@pagedp \dp\@holdpg
311 \@pageht \ht\@holdpg
312 \unvbox \@holdpg
313 \@next\@currbox\@currlist{%
314 \ifnum \count\@currbox>\z@

```

Putting the whole size into `\@pageht` (see above).

```

315 \advance \@pageht \@pagedp
316 \ifvoid\footins \else
317 \advance \@pageht \ht\footins
318 \advance \@pageht \skip\footins
319 \advance \@pageht \dp\footins
320 \fi
321 \ifvbox \@kludgeins

```

We want to make the adjustment due to this insert only if the non-star form is used. The *-form will probably not work with floats, but maybe it still could make some adjustment here even so?

```

322 \ifdim \wd\@kludgeins=\z@
323 \advance \@pageht \ht\@kludgeins
324 (*trace)
325 \fl@trace {Extra size added: \the \ht\@kludgeins}%
326 (/trace)
327 \fi
328 \fi

```

This version puts the inserts back just before the additional material; it could be moved earlier, before unboxing the page-so-far. Neither is guaranteed not to put things on the wrong page. This version is similar to the original version.

```

329         \@reinserts
330         \@addtocurcol
331     \else
332         \@reinserts
333         \@addmarginpar
334     \fi
335 } \@latexbug

```

A 2e change: use `\addpenalty` instead of `\penalty` here. Some penalty is needed to create a potential break-point immediately after the reinserts (or the marginal). Otherwise there can be no possibility to break here and this can cause the reinserts or the marginal to appear on the next page (which is often incorrect). However, if the nobreak flag is true, a `\nobreak` must be correct.

```

336     \ifnum \outputpenalty<\z@
337     \if@nobreak
338         \nobreak
339     \else
340         \addpenalty \interlinepenalty
341     \fi
342 \fi
343 \fi
344 \fi
345 }
346 </2kernel | fltrace>

```

(End of definition for \output and \@specialoutput.)

`\@testwrongwidth` Test if the float box has the wrong width when trying to place it into some area. (Actually the test is for a conventional depth setting rather than for the width of the float. For that reason the box depth was explicitly tailored when the float was created).

`\f@depth`

```

347 <[latexrelease]\IncludeInRelease{2015/01/01}%

372 <latexrelease>\EndIncludeInRelease

```

(End of definition for \@testwrongwidth and \f@depth.)

\@docclearpage This is a very much an emergency action, just dumping everything: footnotes first then floats. A more sophisticated version is needed; but even more urgent is a bug-free version (see, for example, pr/3528).

Also, it puts any left-over non-boxes (writes, specials, etc.) back after any float pages created: this is a very bad bug since, for example, a kludge insert will be in quite the wrong place and, worse, be irremovable and uncancelable.

All the remaining changes are replacing the double column defer list or inserting the extra test \@testwrongwidth{<box>} at suitable places. That is at places where a box is taken off the deferlist.

```

475 <*trace>
476   \fl@trace{PAGE: one column (float? see above) page completed}%
477 </trace>

```

Not needed since it comes after \outputpage:

```

478 %   \global\@colht\textheight
479   \fi

```

These do not need to be done every time \@opcol is used: they should be grouped together since they all need to be done at the end of the non-special output routine, or at the end of a clearpage one.

```

480   \global \@mparbottom \z@ \global \@textfloatsheight \z@
481   \floatplacement
482 }
483 </2kernel | ftrace>

```

(End of definition for \@opcol.)

`\@makecol` We must rewrite this macro to allow for variations in page-makeup required by changes in page-length.

This uses a different macro if a special-length column is being produced.

```

484 (*2kernel)
485 \gdef \@makecol {%
486   \ifvoid\footins
487     \setbox\@outputbox \box\@cclv
488   \else
489     \setbox\@outputbox \vbox {%

```

This `\boxmaxdepth` setting is to ensure that deep footnotes do not overwrite the footer (on account of the negative skip added later): it should use `\@maxdepth` otherwise the change is pointless when there are footnotes.

But see also its use when combining floats.

```

490   \boxmaxdepth \@maxdepth

491 %       \@tempdima\dp\@cclv
492   \unvbox \@cclv
493 %       \vskip-\@tempdima
494   \vskip \skip\footins

495   \color@begingroup
496     \normalcolor
497     \footnoterule
498     \unvbox \footins
499   \color@endgroup
500 }%
501 \fi

```

The h floats have now been finally committed to this page so we can reset their list. The top and bottom floats are then added to the page.

```

502 \let\@elt\relax
503 \xdef\@freelist{\@freelist\@midlist}%

504 \global \let \@midlist \@empty
505 \@combinefloats

```

The variations start here in case `\enlargethispage` has been used.

```

506 \ifvbox\@kludgeins
507   \@makespecialcolbox
508 \else

```

This extra reboxing is only needed to add the `\@texttop` and `\@textbottom` but this could be done earlier, when the floats are added.

The `\boxmaxdepth` resetting here will have no effect unless `\@textbottom` ends with a box or rule. So is this (or possibly `\@maxdepth`) the correct value?

The `\vskip_\dimen` ensures that the visible depth of the box does not affect the placement of anything on the page. Thus very deep pages will overprint the footer; but these should have been prevented by suitable settings of the maxdepths at appropriate times.

If `\@textbottom` ends with a box or rule of non-zero depth then this skip adjustment should be done again after it.

I think that the final boxing of the main text page could have a common ending which may make it simpler to see what is going on.

This needs further investigation, especially in the ‘special case’.

Also, the `\boxmaxdepth` setting here affects what happens within `\@texttop` and `\@textbottom`, should it? Is it needed at all?

RmS 91/10/22: Replaced `\dimen128` by `\dimen@`.

```

509     \setbox\@outputbox \vbox to\@colht {%
510 %       \boxmaxdepth \maxdepth           %??
511     \@texttop
512     \dimen@ \dp\@outputbox
513     \unvbox \@outputbox
514     \vskip -\dimen@
515     \@textbottom
516     }%
517 \fi
518 \global \maxdepth \@maxdepth
519 }
```

(End of definition for \@makecol.)

\@reinserts This is the code which reinserts the inserts. It puts them all in one place; this can make some of them come out on the wrong page. It has been put into a separate macro to expedite experimentation.

```

520 \gdef \@reinserts{%
521   \ifvoid\footins\else\insert\footins{\unvbox\footins}\fi
522   \ifvbox\@kludgeins\insert\@kludgeins
523     {\unvbox\@kludgeins}\fi
524 }
525 \</2ekernel>
```

(End of definition for \@reinserts.)

\@makespecialcolbox This implements certain variations in page-makeup.

```

526 <*2ekernel | fltrace>
527 \gdef \@makespecialcolbox {%
528 <*trace>
529   \fl@trace{Kludgeins ht \the\ht\@kludgeins\space
530             dp \the\dp\@kludgeins\space
531             wd \the\wd\@kludgeins}%
532 </trace>
```

First we find the natural height of the column.

See above for discussion of what is happening here.

This needs further investigation, especially in this ‘special case’.

```

533 \setbox\@outputbox \vbox {%
534   \@texttop
535   \dimen@ \dp\@outputbox
536   \unvbox\@outputbox
537   \vskip-\dimen@
538   }%
539 \@tempdima \@colht
540 \ifdim \wd\@kludgeins>\z@
```

Note that in this case (the *-version), the height of the `\@kludgeins` box is not used since its value is somewhat arbitrary: it need only be big enough to ensure that the page-break is not taken prematurely.

Here we calculate how much vertical space needs to be added in order to enable the column to fit into a box of size `\@colht` using the best information we have about the amount of shrink available (another thing which is known internally about a box, but cannot be accessed at the \TeX level!).

This needs \TeX 3 otherwise `\pageshrink` is zero anyway; it may not be exactly the figure we wish as it is the total available from the all the material collected before the page-break decision is made. It will, we think, always be an overestimate of the actual shrink in the box; therefore this should always force the shortest possible column with the possibility of an overfull box.

This should work for both flush- and ragged-bottom setting since it makes the contents no smaller than the size (`\@colht`) of the box into which they are put.

Their should perhaps be an upper limit, of 0pt?, on the extra space added to force shrinking.

See above for a discussion of the `\boxmaxdepth` setting here.

```

541     \advance \@tempdima -\ht\@outputbox
542     \advance \@tempdima \pageshrink
543 < *trace >
544     \fl@trace {Natural ht of col: \the \ht\@outputbox}%
545     \fl@trace {\string \@colht: \the \@colht}%
546     \fl@trace {Pageshrink added: \the \pageshrink}%
547     \fl@trace {Hence, space added: \the \@tempdima}%
548 < /trace >
549     \setbox\@outputbox \vbox to \@colht {%
550 %       \boxmaxdepth \maxdepth
551       \unvbox\@outputbox
552       \vskip \@tempdima
553       \@textbottom
554     }%
```

For the unstarred version, the final size of the page is precisely specified. Therefore, at least for the flush-bottom case, we need to ensure that, visually, it has this size exactly.

Thus we calculate this size and set the material in a box of this size, which is then put into a box of size `\@colht` with `\vss` at the bottom.

```

555     \else
556     \advance \@tempdima -\ht\@kludgeins
557 < *trace >
558     \fl@trace {Natural ht of col: \the \ht\@outputbox}%
559     \fl@trace {\string \@colht: \the \@colht}%
560     \fl@trace {Extra size added: -\the \ht \@kludgeins}%
561     \fl@trace {Hence, height of inner box: \the \@tempdima}%
562     \fl@trace {Max? pageshrink available: \the \pageshrink}%
563 < /trace >
```

This type of final packaging could be done always; this may simplify all of this page-makeup.

It is not necessary to set `\boxmaxdepth` here since the `\@outputbox` ends with glue.

```

564     \setbox \@outputbox \vbox to \@colht {%
565       \vbox to \@tempdima {%
```

```

566         \unvbox\@outputbox
567         \@textbottom}%
568     \vss}%
569 \fi

```

Finally we need to explicitly make the insert box void.

```

570     {\setbox \@tempboxa \box \@kludgeins}%
571 \<trace>
572     \fl@trace {kludgeins box made void}%
573 \</trace>
574 }
575 \</2ekernel | fltrace>

```

(End of definition for \@makespecialcolbox.)

```

\@texttop These do nothing as a default.
\@textbottom
576 \<*2ekernel>
577 \let \@texttop \relax
578 \let \@textbottom \relax

```

(End of definition for \@texttop and \@textbottom.)

\@resetactivechars RmS 93/09/06: added hook to protect against certain active characters in the output routine. Default checks are for active space and end-of-line.

```

579 \def\@activechar@info #1{%
580     \@latex@info@no@line {Active #1 character found while
581                             output routine is active
582                             \MessageBreak
583                             This may be a bug in a package file
584                             you are using}%
585 }

```

Do not put any spaces in this next bit!

```

586 \begingroup
587 \obeylines\obeyspaces%
588 \catcode'\'\active%
589 \gdef\@resetactivechars{%
590 \def~M{\@activechar@info{EOL}\space}%
591 \def {\@activechar@info{space}\space}%
592 \let'\active@math@prime}%
593 \endgroup

```

(End of definition for \@resetactivechars and \@activechar@info.)

\@outputpage The `\color@hbox` hooks here are used to avoid putting just a colour special into an otherwise empty box (in a header or footer). These boxes are often set to be completely empty and so adding a special produces a very underfull box message.

\@shipoutsetup

\@writesetup

There has been extensive tidying up of the old code here; including the removal of a level of grouping.

The setting of `\protect` immediately before the `\shipout` is needed so that protected commands within `\writes` are handled correctly.

Within `shipout`'s vbox it is reset to its default value, `\relax`.

Resetting it to its default value after the `shipout` has been completed (and the contents of the `writes` have been expanded) must be done by use of `\aftergroup`. This

is because it must have the value `\relax` before macros coming from other uses of `\aftergroup` within this box are expanded.

Putting this into the `\aftergroup` token list does not affect the definition used in expanding the `\writes` because the `aftergroup` token list is only constructed when popping the save-stack, it is not expanded until after the shipout is completed.

Question: should things from an `\aftergroup` within the shipped out box be executed in the environment set up for the writes, or after it finishes?

A lot of this code has been in-lined to prevent mis-use of internal commands as hooks.

```
594 </2ekernel>
595 <latexrelease>\IncludeInRelease{2017/04/15}%
596 <latexrelease> {\@outputpage}{Reset language for hyphenation}%
597 <*2ekernel|latexrelease>
598 \def\@outputpage{%
```

The `\endgroup` is put in by `\aftergroup`.

```
599 \begingroup
```

Now all the set-up stuff has been in-lined for Frank.

First the stuff for the writes.

From here ... was in the command `\@writesetup`.

```
600 \let \protect \noexpand
```

RmS 93/08/19: Redefined accents to allow changes in font encoding; but exactly why was this needed?

Reset `\language` to the value current at `\begin{document}`. In particular this ensures that a pagebreak in `verbatim` does not prevent hyphenation in the page head.

```
601 \language\document@default@language
```

The `\catcode'_10` was removed as it was considered useless (presumably because nothing gets tokenized during shipout).

This was put in as some error produced active spaces in a mark, I think.

Why was the hyphen reset?

```
602 \@resetactivechars
```

If a page break happens between the start of a list and its first item the `@newlist` will be true and this will mess up any list that is used in the header or footer of the page. So we have to reset that flag.

```
603 \global\let\@@if@newlist\if@newlist
604 \global\@newlistfalse
```

This next hook replaces the following:

```
\let\-\@dischph
\let'\@acci\let'\@accii\let\=\@acciii
\let\\\@normalcr
\let\par\@par %% 15 Sep 87 (this was once inside the box)
```

and it does more than they did; in particular it sets:

```

\parindent\z@
\parskip\z@skip
\everypar{}%
\leftskip\z@skip
\rightskip\z@skip
\parfillskip\@flushglue
\lineskip\normallineskip
\baselineskip\normalbaselineskip
\sloppy

```

```
605 \@parboxrestore
```

... to here was in the command \@writesetup.

```

606 \shipout \vbox{%
607   \set@typeset@protect
608   \aftergroup \endgroup

```

Correct? or just restore by ending the group?

```
609 \aftergroup \set@typeset@protect
```

This first bit has been moved inside the shipped out box.

Now the setup inside the shipped out box; this should contain all the stuff that could only affect typesetting; other stuff may need to be reset for the writes also.

From here ... was in the command \@shipoutsetup.

```

610 \if@specialpage
611   \global\@specialpagefalse\@nameuse{ps@\@specialstyle}%
612 \fi
613 \if@twoside
614   \ifodd\count\z@ \let\@thehead\@oddhead \let\@thefoot\@oddfoot

```

(End of definition for `\@comflelt`, `\@comdblfilelt`, and `\@combinedblfloats`.)

`\@startcolumn` We could combine (most of) these two into `\@startcolumn<list>`. Note that `\@xstartcol` was only used once (i.e. in `\@startcolumn`); it has therefore been removed. This is not quite as efficient but it now has the same structure as `\@startdblcolumn`.

The empty-list test has been moved to `\@tryfcolumn`.

```

779 \if*2kernel\iftrace
780 \def \@startcolumn {%
781 \global \@colroom \@colht
782 \@tryfcolumn \@deferlist
783 \if@fcolmade
784 \if*trace
785 \fl@trace{PAGE: float \if@twocolumn column \else page \fi
786 completed}%
787 \if*trace
788 \else
789 \begingroup
790 \let \reserved@b \@deferlist
791 \global \let \@deferlist \empty
792 \let \@elt \@scolelt
793 \reserved@b
794 \endgroup
795 \fi
796 }

```

This one does not need to set \@colht.

```

1151 < /trace >

```

CHANGE TO \@addtocurcol:

\penalty\z@ changed to \penalty\interlinepenalty so \samepage works properly with figure and table environments. (Changed 23 Oct 86)

There is also an \addpenalty\interlinepenalty above.

Although it is best to use \addvspace in case two h floats come together, this makes other spacing more difficult to adjust; whereas if a user specifies two h floats together then they can more easily get the spacing correct by ad hoc commands.

It is necessary to adjust for the addition of \parskip here in case the float is added between paragraphs (i.e. when in vertical mode).

If the nobreak switch is true we need to reset it and clear `\everypar` since the float may not reset the flag and cannot reset the `\everypar` globally.

Typesetting starts here (we are in vertical mode).

```

1152         \if@nobreak
1153         \nobreak
1154         \@nobreakfalse
1155         \everypar{}%
1156     \else
1157         \addpenalty \interlinepenalty
1158     \fi
1159     \vskip \intextsep
1160     \box\@currbox
1161     \penalty\interlinepenalty
1162     \vskip\intextsep
1163     \ifnum\outputpenalty <-\@Mii \vskip -\parskip\fi

```

Typesetting ends here.

```

1164         \outputpenalty \z@
1165         \@inserttrue
1166     < *trace >
1167         \else
1168             \fl@trace{Fail---no room at 2nd test of colroom
1169                 (addtocorcol \string\intextsep)}%
1170 < /trace >
1171         \fi
1172     \fi
1173     \if@insert
1174     \else

```

Next set of docstrip guards are a bit weird, essentially `\@addtotoporbot` ends up inside the kernel and the `fltrace` package and `\@addtobot` shows up in the `flafter` package. Guess that could have been done a bit more obvious :-)

1241 <latexrelease | fltrace | flafter> \@flsettextmin

```

This is a new adjustment which is quite a major change in functionality; but it implements the documentation. Note that `\@reqcolroom` will include the whole of the page-so-far, and hence includes `\@textfloatsheight` of floats, so before comparing it with `\@textmin`, we add this to `\@textmin` also.

```

1242 <*trace>

CHANGE TO \@addtocurcol:

\penalty\z@ changed to \penalty\interlinepenalty so \samepage works properly with figure and table environments. (Changed 23 Oct 86)

There is also an \addpenalty\interlinepenalty above.

Although it is best to use \addvspace in case two h floats come together, this makes other spacing more difficult to adjust; whereas if a user specifies two h floats together then they can more easily get the spacing correct by ad hoc commands.

It is necessary to adjust for the addition of \parskip here in case the float is added between paragraphs (i.e. when in vertical mode).

If the nobreak switch is true we need to reset it and clear \everypar since the float may not reset the flag and cannot reset the \everypar globally.

Typesetting starts here (we are in vertical mode).

```

1318 <latexrelease | fltrace | flafter>             \ifnobreak
1319 <latexrelease | fltrace | flafter>             \nobreak
1320 <latexrelease | fltrace | flafter>             \@nobreakfalse
1321 <latexrelease | fltrace | flafter>             \everypar{}%
1322 <latexrelease | fltrace | flafter>             \else

\@addmarginpar

```

1815 <*2ekernel>
1816 \def\@addmarginpar{\@next\@marbox\@currlist{\@cons\@freelist\@marbox
1817 \@cons\@freelist\@currbox}\@latexbug\@tempcnta\@one
1818 \if@twocolumn
1819 \if@firstcolumn \@tempcnta\m@ne \fi
1820 \else
1821 \if@mparswitch
1822 \ifodd\c@page \else\@tempcnta\m@ne \fi
1823 \fi
1824 \if@reversemargin \@tempcnta -\@tempcnta \fi
1825 \fi
1826 \ifnum\@tempcnta <\z@ \global\setbox\@marbox\box\@currbox \fi
1827 \@tempdima\@mparbottom
1828 \advance\@tempdima -\@pageht
1829 \advance\@tempdima\ht\@marbox
1830 \ifdim\@tempdima >\z@
1831 \@latex@warning@no@line {Marginpar on page \thepage\space moved}%
1832 \else
1833 \@tempdima\z@
1834 \fi
1835 \global\@mparbottom\@pageht
1836 \global\advance\@mparbottom\@tempdima
1837 \global\advance\@mparbottom\dp\@marbox
1838 \global\advance\@mparbottom\marginparpush
1839 \advance\@tempdima -\ht\@marbox

```

Putting box movement inside the ‘marbox’:

```

1840 \global\setbox \@marbox
1841 \vbox {\vskip \@tempdima
1842 \box \@marbox}%
1843 \global \ht\@marbox \z@
1844 \global \dp\@marbox \z@

```

Sticking (rather than gluing:-) the ‘marbox’ to the line above, changed vskip to kern:

```

1845 \kern -\@pagedp
1846 \nointerlineskip
1847 \hb@xt@\columnwidth

```

```

1848      {\ifnum \@tempcnta >\z@
1849        \hskip\columnwidth \hskip\marginparsep
1850        \else
1851          \hskip -\marginparsep \hskip -\marginparwidth
1852        \fi
1853        \box\@marbox \hss}%

```

For this reason the following code can vanish:

```

      \nobreak          %% No longer needed.  CAR92/12
      \vskip -\@tempdima  %% No longer needed.  CAR92/12

1854      \nointerlineskip
1855      \hbox{\vrule \@height\z@ \@width\z@ \@depth\@pagedp}}

```

(End of definition for \@addmarginpar.)

1.1.1 Kludgeins

This part of the file is part of the implementation of the following two new commands for L^AT_EX2e.

`\enlargethispage{<dim>}`

Adds <dim> to the height of the current column only. On the printed page the bottom of this column is extended downwards by exactly <dim> without having any effect on the placement of the footer; this may result in an overprinting.

`\enlargethispage*{<dim>}`

Similar to `\enlargethispage` but it tries to squeeze the column to be printed in as small a space as possible, ie it uses any shrinkability in the column. If the column was not explicitly broken (e.g. with `\pagebreak`) this may result in an overfull box message but except for this it will come out as expected (if you know what to expect).

The star form of this command is dedicated to Leslie Lamport, the other we need for ourselves (FMi, CAR).

These commands may well have unwanted effects if used soon before a `\clearpage`: please give keep them clear of such places.

`\@kludgeins` The insert which makes T_EX do a lot of the necessary work. All we need to put into it is the amount by which the pagegoal should be changed.

```

1856 \newinsert \@kludgeins
1857 \global\dimen\@kludgeins \maxdimen
1858 \global\count\@kludgeins 1000

```

(End of definition for \@kludgeins.)

`\enlargethispage` The user command.

```

\enlargethispage* 1859 \gdef \enlargethispage {%
1860   \@ifstar
1861   {%
1862     \*trace
1863     \fl@trace{Enlarging page height * }%
1864     \*trace
1865     \@enlargepage{\hbox{\kern\p@}}}%

```

```

1866      {%
1867      <*trace>
1868      \fl@trace{Enlarging page height exactly---}%
1869      </trace>
1870      \@enlargepage\@empty}%
1871  }

```

(End of definition for \enlargethispage and \enlargethispage*.)

\@enlargepage This actually inserts the insert, after checking for extreme values of the change.

```

1872  \gdef\@enlargepage#1#2{%
1873  <*trace>
1874    \fl@trace{\@spaces\@spaces by #2}%
1875  </trace>
1876    \@tempskipa#2\relax
1877    \ifdim \@tempskipa>.5\maxdimen
1878      \latex@error{Suggested\space extra\space height\space
1879                  (\the\@tempskipa)\space dangerously\space
1880                  large}\@eha
1881    \else
1882      \ifdim \vsize<.5\maxdimen
1883      <*trace>
1884        \fl@trace {Kludgeins added--pagegoal before: \the\pagegoal}%
1885      </trace>
1886        \@bsphack
1887        \insert\@kludgeins{#1\vskip-\@tempskipa}%
1888        \@esphack

```

This next bit is for tracing only:

```

1889  <*trace>
1890    \ifvmode \par
1891      \fl@trace {Kludgeins added--pagegoal after: \the \pagegoal}%
1892    \fi
1893  </trace>
1894    \else
1895      \latex@error{Page\space height\space already\space
1896                  too\space large}\@eha
1897    \fi
1898  \fi
1899  }

```

(End of definition for \@enlargepage.)

\ShowFloat This command provides some information about the contenta of a float register. Float registers have internal names of the form `\bx@{Uppercase-letter(s)-or numbers}` and you specify just this letter or letters as the argument, e.g., `\ShowFloat{A}`. (There is not much error recovery if you specify something that isn't a float.)

```

1900  </2ekernel>
1901  <*2ekernel | latexrelease>
1902  <latexrelease>\IncludeInRelease{2021/11/15}%
1903  <latexrelease>          {\ShowFloat}{Show float register contents}%
1904  \def\ShowFloat#1{\begingroup
1905    \let \fl@trace \fl@tracemessage
1906    \fl@trace{***Float #1 details:}%
1907    \ifcsname bx@#1\endcsname

```

```

1908     \expandafter\fl@ShowFloat\csname bx@#1\endcsname
1909     \else
1910         \fl@trace{Not a float!}%
1911     \fi
1912 \endgroup
1913 }
1914 \def\fl@ShowFloat#1{%
1915     \fl@traceval{\count#1}% % this here should be interpreted on day
1916     \fl@traceval{\ht#1}%
1917     \fl@traceval{\dp#1}%
1918     \fl@traceval{\wd#1}%
1919     {\tracingonline1\showboxbreadth10\showboxdepth3\showbox#1}%
1920 }

```

Here are two definitions from `fltrace` that make the above code work:

```

1921 \def \fl@traceval #1{\fl@trace{\string #1 = \the #1}}
1922 \def \fl@tracemessage #1{{\let\@elt\@empty\typeout{LaTeX2e: #1}}}
1923 </2kernel | latexrelease>
1924 <latexrelease>\EndIncludeInRelease
1925 <latexrelease>\IncludeInRelease{0000/00/00}%
1926 <latexrelease>                {\ShowFloat}{Show float register contents}%
1927 <latexrelease>
1928 <latexrelease>\let\ShowFloat\@undefined
1929 <latexrelease>\let\fl@ShowFloat\@undefined
1930 <latexrelease>\let\fl@traceval\@undefined
1931 <latexrelease>\let\fl@tracemessage\@undefined
1932 <latexrelease>\EndIncludeInRelease

```

(End of definition for \ShowFloat.)

1.1.2 Float control

This part implements controllable floats and other changes to the float mechanism.

It provides, at the document level, the following command for inclusion in `LATEX2e`.

`\suppressfloats`

This suppresses all further floats on the current page.

With an optional argument it suppresses only floats only in certain positions on the current page.

[t] suppresses only floats at the top of the page [b] suppresses only floats at the bottom of the page

It also enables the use of an extra specifier, `!`, in the location optional argument of a float. If this is present then, just for this particular float, whenever it is processed by the float mechanism the following are ignored:

- all restrictions on the number of floats which can appear;
- all explicit restrictions on the amount of space which should (not) be occupied by floats and/or text.

The mechanism will still attempt to ensure that pages are not overfull.

These specifiers override, for the single float, the suppression commands described above.

In its current form, it also supplies a reasonably exhaustive, and somewhat baroque, means of tracing some aspects of the float mechanism.

More tracing.

```

\fl@trace Set-up tracing for floats independent of other tracing as it produces mega-output. Default
\tracefloatsoff is no tracing.

We need to make sure that `fltrace` comes before `flafter` to make the tracing work.

```

1996 \@ifpackageloaded{flafter}
1997 {
1998   \PackageWarningNoLine
1999     {fltrace}{Load 'fltrace' before 'flafter'\MessageBreak
        Attempting to recover by reloading 'flafter'}}%
2000 \expandafter\let\csname ver@flafter.sty\endcsname\relax
2001 \def\reserved@a#1{%
2002   \expandafter\let\csname string#1+flafter+IIR\endcsname\relax}%
2003 \reserved@a\@addtocurcol
2004 \reserved@a\@addtonextcol
2005 \RequirePackage{flafter}}{}
2006 \</fltrace>

```

As the code for `flafter` will contain tracing calls so that it works in conjunction with `fltrace` we need to provide a dummy definition for `\fl@trace` in that package.

```

2007 \<flafter>
2008 \providecommand\fl@trace[1]{}
2009 \</flafter>

```

(End of definition for \fl@trace and others.)

`\suppressfloats` Float suppression commands: these set the relevant counter globally to zero. Thus they
`\@flstop` are overridden for a particular float by an `!` specifier.

```

2010 \<*2ekernel>
2011 \def \suppressfloats {%
2012   \@ifnextchar [%

```

```

2013     \@flstop
2014     {\global \@colnum \z@}%
2015 }

```

Maybe this should be a loop over #1?

```

2016 \def \@flstop [#1]{%
2017     \if t#1%
2018         \global \@topnum \z@
2019     \fi
2020     \if b#1%
2021         \global \@botnum \z@
2022     \fi
2023 }

```

(End of definition for `\suppressfloats` and `\flstop`.)

Manipulation of float placement and type; both their strings and the corresponding count registers.

`\@fpstype`
`\@reqcolroom`
`\@textfloatsheight`

First a new count register to go with `\@currtype`.

Then a new skip register, for information needed to remove the `\@maxsep` conservatism: it is possible that this could use a temporary register.

Finally a dimension register to hold the total height of in-text floats on the current page. This is needed to implement a major change in the functionality of `\@addtocurcol` which is, nevertheless, a bug fix. It is not local and therefore cannot be a temporary register.

```

2024 \newcount \@fpstype
2025 \newdimen \@reqcolroom
2026 \newdimen \@textfloatsheight
2027 \</2kernel>

```

(End of definition for `\@fpstype`, `\@reqcolroom`, and `\@textfloatsheight`.)

`\@fpsadddefault`

Adds the default placement to what is already there.

Should not need to change this, but could do it as follows:

```

def \@fpsadddefault {%
    \@temptokena \expandafter\expandafter\expandafter
        {\csname fps@\@capytype \endcsname}%
    \edef \reserved@a {\the\@temptokena}%
    \@onelevel@sanitize \reserved@a
    \edef \@fps {\@fps\reserved@a}%
}

```

```

2028 \<*2kernel|fltrace>
2029 \def \@fpsadddefault {%
2030 \<*trace>
2031     \fl@trace{fps changed from: \@fps}%
2032 \</trace>
2033     \edef \@fps {\@fps\csname fps@\@capytype \endcsname}%
2034     \@latex@warning {%
2035         No positions in optional float specifier.\MessageBreak
2036         Default added (so using '\@fps')}%
2037 }

```

(End of definition for `\@fpsadddefault`.)

`\@setfloattypescounts` Sets counters `\@fpstype` and `\@currtype`.
BANG == bit4 of `\count\@currbox` = 0.

```

2038 \def \@setfloattypescounts {%
2039   \@currtype \count\@currbox

2104 't' added to '\reserved@a h'- new Count: \the \count\@currbox}%
2105 </trace>
2106 \fi
2107 }

```

(End of definition for \@resethfps.)

Special stuff for BANG floats.

\@flsetnum Ignores any zero float counter value in case BANG.

It uses a local assignment to the normally global counter: a bit naughty, perhaps?

These assignments are safe so long as the counter involved is only consulted once (i.e. only for the 'bang float') with the changed value. This is the case within \@addtocurcol because it is used only once within a call of the output routine (which forms a group).

For \@addtonextcol this is achieved by putting a group around its code; this is needed because it is called (by \@startcolumn) for each float which was on the deferlist.

Almost identical considerations pertain to \@addtodblcol. There may be more efficient ways to handle this, but the group seems to be the simplest.

```

2108 \def \@flsetnum #1{%
2109 <*trace>
2110   \fl@trace{fpstype: \the \@fpstype (flsetnum \string#1)}%
2111 </trace>
2112   \ifnum \@fpstype<\sist@@n
2113     \ifnum #1=\z@

```

(End of definition for `\@flupdates`.)

Interesting facts about float mechanisms past and present, together with a summary of various features, some unresolved:

1. The value `\textfraction` does not affect the processing of doublecol floats: this seems sensible, but should be documented.
2. `\twocolumn floatplacement` was wrong: `dbl` not needed, `ord` needed.
3. `\floatplacement` was not called after `\@startdblcol` or `\@topnewpage`. This has been changed; it is clearly a bug fix.
4. The use `\@topnewpage` when `\dblfigrule` is non-trivial produced a rule in the wrong place. This has been fixed by not using `\dblfigrule` when processing the ‘float’ from `\@topnewpage`.
5. If the specifier was just `h` and the float could not be put here, it went on the deferlist and stayed there until a `clearpage`. It now gets changed to a ‘`th`’: this is only an error-recovery action, putting just `h` or `!h` should be deprecated.
6. `\@dblmaxsep` was ‘the maximum of `\dblfloatsep` and `\dbltextfloatsep`’. But it was never used! Now gone completely, like `\@maxsep`.
7. After an `h` float is put on a page, it was counted as text when applying the `\textfraction` test; this is possibly too big a change although it is a bug fix?
8. Two consecutive `h` floats are separated by twice `\intertextsep`: this could be changed to one by use of `\addvspace`, OK? Note that it would also mean that less space is put in if an `h` float immediately follows other spaces. This is also possibly too big a change, at least for compatibility mode? Or it may be simply wrong! It has not been changed.
9. Now `\@addtocurcol` checks first for just `p` fps. I think that this is an increase in efficiency, but maybe the coding should be made even more efficient.
10. `\@tryfcolumn` now tests if the list is empty first, otherwise lots of wasted time! Thus this test has been removed from `\@startcolumn`. As Frank pointed out, this makes `\@startcolumn` less efficient. But it is now the same as `\@startdblcolumn`: I can see no reason why they should be different, but which is best?
11. Why is `\@colroom` set in `\@doclearpage`?
12. Footnotes. Check what `\clearpage` does when footnotes are left over. Footnotes are not put on float pages and, also, `\@addtonextcol` ignores the existence of held-over footnotes in deciding what floats can go on the page. Not changed.
13. `\clearpage` can still lose non-boxes, at least when floats are involved. It also moves some to the ‘wrong page’, but this may be a coding problem.
14. The `!` option makes it necessary to check in `\output` that there is enough room left on the page after adding a float. (This would have been necessary anyway if anyone set `\@textmin` too close to zero! A similar danger existed also if the text in a `\twocolumn[text]` entity gets too large.) The current implementation of this also makes the normal case a little less efficient, OK? Not enough room means, at present, less than `\baselineskip`, with a warning: is this OK? Should it be made generic (another parameter)?

15. There are four possibilities for supporting this:

```
\twocolumn[\maketitle\more\text]
```

One is to change `\maketitle` slightly to allow this. Another is to change `\@topnewpage` so that more than one `\twocolumn[]` command is allowed; in this case `\maketitle\twocolumn[more\text]` will work. The former is more robust from the user's viewpoint, but makes the code for `\maketitle` rather ad hoc (maybe it is already?). Another is to misuse the global `twocolumn` flag locally within `\@topnewpage`. Yet another is to move the column count register from the `multicol` package into the kernel. This has been done.

16. Where should the reinserts be put to maximise the probability that footnotes come out on the correct page? Or should we go for as much compatibility as possible (but see next item)?
17. Should we continue to support (as much as possible) `\samepage`? Some of its intended functionality is now advertised as being provided by `\enlargethispage`. Use of either is likely to result in wrongly placed footnotes, marginals, etc. Which should have priority: obeying the pagination instructions, or correct placement of notes/marginalia?
18. Is the adjustment of space to cause shrinking in the kludge-* case correct? Should it be limited to 0pt?
19. Is the setting of `\boxmaxdepth` in `makecol` and friends needed? It only has any effect if `\@textbottom` ends with a box or rule, in which case the `vskip` to allow for its depth should also be added. If it is kept, it should probably be the last thing in the box. It has now been removed.
- It would perhaps be better to document that `\@textbottom` and `\@texttop` must have natural height 0pt.
20. I cannot see why the `vskip` adjustment for the depth is needed if `boxmaxdepth` is used to ensure that there is never a too deep box.
21. The value of `\boxmaxdepth` should be explicitly set whenever necessary: it is too risky to assume that it has any particular value. Care is needed in deciding what to set it to.
- It is interesting to note that the value of `\boxmaxdepth` is unique in being read before the local settings for the box group are reset; all other parameter settings which affect the box construction use their values outside the box group.
22. Should `\@maxdepth` store the setting of `\maxdepth` from `lplain`? Or should we provide a proper interface to class files for setting these?

An analysis of various other macros.

`\@opcol` should do `\@floatplacement`, but where? Right at the end, since it always occurs at the start of a column.

```
\def\@opcol{%
% Why is this done first?
\global \@mparbottom \z@
\if@twocolumn
```

```

\@outputdblcol
\else
\@outputpage
% This is not needed since it is done at the end of
% |\@outputpage|:
\global \colht \textheight
\fi}

Only tracing has been added to these.

```

2241   \global\setbox\@leftcolumn\copy\@outputbox
2242 <fltrace>   \fl@trace{PAGE: first column boxed}%

```

Remember the marks from the first column

```

2243   \splitmaxdepth\maxdimen
2244   \vbadness\maxdimen

```

In case of `\enlargethispage` we will have infinite negative glue at the bottom of the page (coming from `\vss`) and that will earn us an error message if we `\vsplit` to get at the marks. So we need to remove the last glue (if any) at the end of `\@outputbox` as we are only interested in marks that change doesn't matter.

```

2245   \setbox\@outputbox\vbox{\unvbox\@outputbox\unskip}%
2246   \setbox\@outputbox\vsplit\@outputbox to\maxdimen

```

One minor difference from the current `fixmarks` package, pass the marks through a token register to stop any `#` tokens causing an error in a `\def`.

```

2247   \toks@\expandafter{\topmark}%
2248   \xdef\@firstcoltopmark{\the\toks@}%
2249   \toks@\expandafter{\splitfirstmark}%
2250   \xdef\@firstcolfirstmark{\the\toks@}%

```

This test does not work if truly empty marks have been inserted, but \LaTeX marks should always have (at least) two brace groups. (Except before the first mark is used, when the marks are empty, but that is OK here.)

```

2251   \ifx\@firstcolfirstmark\@empty
2252     \global\let\@setmarks\relax
2253   \else
2254     \gdef\@setmarks{%
2255       \let\firstmark\@firstcolfirstmark
2256       \let\topmark\@firstcoltopmark}%
2257   \fi

```

End of change

```

2258   \else
2259     \global\@firstcolumntrue
2260     \setbox\@outputbox\vbox{%
2261       \hb@xt@\textwidth{%
2262         \hb@xt@\columnwidth{\box\@leftcolumn \hss}%
2263         \hfil

```

The color of the `\vrule` should be `\normalcolor` as to not inherit the color from the column.

```

1.1.3 Float placement parameters

The main purpose of this section is to ensure that all the float-placement parameters which need to be set in a class file or package have been declared. It also describes their use and sets values for them which are reasonable for typical documents using US letter or A4 sized paper.

Limits for the placement of floating objects

- \c@topnumber** This counter holds the maximum number of floats that can appear at the top of a text page or column.
- ```

2326 <*2ekernel>
2327 \newcount\c@topnumber
2328 \setcounter{topnumber}{2}

```
- (End of definition for \c@topnumber.)*
- \topfraction** This macro holds the maximum proportion (as a decimal number) of a text page or column that can be occupied by floats at the top.
- ```

2329 \newcommand\topfraction{.7}

```
- (End of definition for \topfraction.)*
- \c@bottomnumber** This counter holds the maximum number of floats that can appear at the bottom of a text page or column.
- ```

2330 \newcount\c@bottomnumber
2331 \setcounter{bottomnumber}{1}

```
- (End of definition for \c@bottomnumber.)*
- \bottomfraction** This macro holds the maximum proportion (as a decimal number) of a text page or column that can be occupied by floats at the bottom.
- ```

2332 \newcommand\bottomfraction{.3}

```
- (End of definition for \bottomfraction.)*
- \c@totalnumber** This counter holds the maximum number of floats that can appear on any text page or column.
- ```

2333 \newcount\c@totalnumber
2334 \setcounter{totalnumber}{3}

```
- (End of definition for \c@totalnumber.)*

`\textfraction` This macro holds the minimum proportion (as a decimal number) of a text page or column that must be occupied by text.

```
2335 \newcommand\textfraction{.2}
```

*(End of definition for \textfraction.)*

`\floatpagefraction` This macro holds the minimum proportion (as a decimal number) of a page or column that must be occupied by floating objects before a ‘float page’ is produced.

```
2336 \newcommand\floatpagefraction{.5}
```

*(End of definition for \floatpagefraction.)*

`\c@dbltopnumber` This counter holds the maximum number of double-column floats that can appear on the top of a two-column text page.

```
2337 \newcount\c@dbltopnumber
2338 \setcounter{dbltopnumber}{2}
```

*(End of definition for \c@dbltopnumber.)*

`\dbltopfraction` This macro holds the maximum proportion (as a decimal number) of a two-column text page that can be occupied by double-column floats at the top.

```
2339 \newcommand\dbltopfraction{.7}
```

*(End of definition for \dbltopfraction.)*

`\dblfloatpagefraction` This macro holds the minimum proportion (as a decimal number) of a page that must be occupied by double-column floating objects before a ‘double-column float page’ is produced.

```
2340 \newcommand\dblfloatpagefraction{.5}
```

*(End of definition for \dblfloatpagefraction.)*

### Floats on a text page

`\floatsep` When a floating object is placed on a page with text, these parameters control the separation between the float and the other objects on the page. These parameters are used for both one-column mode and single-column floats in two-column mode. They are all rubber lengths.

`\textfloatsep` `\floatsep` is the space between adjacent floats that are placed at the top or bottom of the text page or column.

`\intextsep` `\textfloatsep` is the space between the main text and floats at the top or bottom of the page or column.

`\intextsep` is the space between in-text floats and the text.

```
2341 \newskip\floatsep
2342 \newskip\textfloatsep
2343 \newskip\intextsep
2344 \setlength\floatsep {12\p@ \@plus 2\p@ \@minus 2\p@}
2345 \setlength\textfloatsep{20\p@ \@plus 2\p@ \@minus 4\p@}
2346 \setlength\intextsep {12\p@ \@plus 2\p@ \@minus 2\p@}
```

*(End of definition for \floatsep, \textfloatsep, and \intextsep.)*

`\dblfloatsep` `\dbltextfloatsep` When double-column floats (floating objects that span the whole `\textwidth`) are placed at the top of a text page in two-column mode, the separation between the float and the text is controlled by `\dblfloatsep` and `\dbltextfloatsep`. They are rubber lengths.

`\dblfloatsep` is the space between adjacent double-column floats placed at the top of the text page.

`\dbltextfloatsep` is the space between the main text and double-column floats at the top of the page.

```
2347 \newskip\dblfloatsep
2348 \newskip\dbltextfloatsep
2349 \setlength\dblfloatsep{12\p@ \@plus 2\p@ \@minus 2\p@}
2350 \setlength\dbltextfloatsep{20\p@ \@plus 2\p@ \@minus 4\p@}
```

*(End of definition for `\dblfloatsep` and `\dbltextfloatsep`.)*

### Floats on their own page or column

`\@fptop` `\@fpsep` `\@fpbot` When floating objects are placed on a separate page or column, called a ‘float page’, the layout of the page is controlled by these parameters, which are rubber lengths.

At the top of the page `\@fptop` is inserted; typically this supplies some stretchable whitespace. At the bottom of the page `\@fpbot` is inserted. Between adjacent floats `\@fpsep` is inserted.

These parameters are used for all floating objects on a ‘float page’ in one-column mode, and for single-column floats in two-column mode.

Note that at least one of the two parameters `\@fptop` and `\@fpbot` should contain a `plus...fil` so as to fill the remaining empty space.

```
2351 \newskip\@fptop
2352 \newskip\@fpsep
2353 \newskip\@fpbot
2354 \setlength\@fptop{0\p@ \@plus 1fil}
2355 \setlength\@fpsep{8\p@ \@plus 2fil}
2356 \setlength\@fpbot{0\p@ \@plus 1fil}
```

*(End of definition for `\@fptop`, `\@fpsep`, and `\@fpbot`.)*

`\@dblftop` Double-column ‘float pages’ in two-column mode use similar parameters.

```
\@dblfpsep 2357 \newskip\@dblftop
\@dblfpbot 2358 \newskip\@dblfpsep
2359 \newskip\@dblfpbot
2360 \setlength\@dblftop{0\p@ \@plus 1fil}
2361 \setlength\@dblfpsep{8\p@ \@plus 2fil}
2362 \setlength\@dblfpbot{0\p@ \@plus 1fil}
```

*(End of definition for `\@dblftop`, `\@dblfpsep`, and `\@dblfpbot`.)*

`\topfigrule` `\botfigrule` `\dblfigrule` The macros can be used to put in rules between floats and text; whatever they insert should be vertical mode material which takes up zero space.

```
2363 \let\topfigrule=\relax
2364 \let\botfigrule=\relax
2365 \let\dblfigrule=\relax
2366 \endkernel
```

*(End of definition for `\topfigrule`, `\botfigrule`, and `\dblfigrule`.)*

## File bb

# lthyphen.dtx

This file contains the code for loading hyphenation patterns into L<sup>A</sup>T<sub>E</sub>X. Most of this will end up in a file called `hyphen.ltx`. If you wish to customize your L<sup>A</sup>T<sub>E</sub>X system in respect of hyphenation patterns, write a file `hyphen.cfg`. If this file exists, it will be loaded instead of `hyphen.ltx`. See the comments below for additional information.

To produce the printed version of this file the following code is used. It can be extracted with the DOCSTRIP program, or one can run this file directly through L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>.

```
1 <*driver>
2 \documentclass{ltxdoc}
3 \begin{document}
4 \DocInput{lthyphen.dtx}
5 \end{document}
6 </driver>
```

The default file `hyphen.ltx` loads hyphenation patterns for US english. If you want to load additional or other hyphenation patterns, you should create a file `hyphen.cfg`. This is best done by starting from `hyphen.ltx`.

For backward compatibility, the default file, `hyphen.ltx`, first tries to load the file `hyphen.tex`. If this file exists, an information message is issued and the appropriate defaults for T<sub>E</sub>X's internal parameters are set: `\language` is initialized to 0, and `\lefthyphenmin` and `\righthyphenmin` to 2 and 3, respectively, to disallow x- or -xx breaks.

```
7 <*default>
8 \InputIfFileExists{hyphen.tex}%
9 {\message{Loading hyphenation patterns for US english.}}%
10 \language=0
11 \lefthyphenmin=2 \righthyphenmin=3 }%
```

Otherwise, since we cannot do anything without any hyphenation patterns, an error message is printed and the IniT<sub>E</sub>X run is terminated by invoking `\@@end` (which is the L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> name for T<sub>E</sub>X's `\end` primitive).

```
12 {\errhelp{The configuration for hyphenation is incorrectly
13 installed.^^J%
14 If you don't understand this error message you need
15 to seek^^Jexpert advice.}%
16 \errmessage{OOPS! I can't find any hyphenation patterns for
17 US english.^^J \space Think of getting some or the
18 latex2e setup will never succeed}\@@end}
19 </default>
```

The following example describes the possible contents of a file `hyphen.cfg` that will load both US English and German hyphenation patterns, making the former the default. It sets `\language` to 0 for the US patterns and to 1 for the German patterns. Then `\language` is set to 0 to make this the default and the default values of `\lefthyphenmin` and `\righthyphenmin` are set.

```
language=0
input hyphen % (or \input ushyphen1 if the file has been renamed)
language=1
input ghyph31
```

```
language=0
lefthyphenmin=2
righthyphenmin=3
endinput
```

Another possibility is to use the package `babel`, by Johannes Braams. That package is distributed with a suitable `hyphen.cfg` file.

# File cc

## ltxfinal.dtx

### 1 Final settings

This section contains the final settings for L<sup>A</sup>T<sub>E</sub>X. It initializes some debugging and typesetting parameters, sets the default `\catcodes` and `uc/lc` codes, and inputs the hyphenation file.

#### 1.1 Debugging

By default, L<sup>A</sup>T<sub>E</sub>X shows statistics:

```
1 <*2ekernel>
2 \tracingstats1
```

#### 1.2 Typesetting parameters

```
\@lowpenalty These are penalties used internally.
\@medpenalty 3 \newcount\@lowpenalty
\@highpenalty 4 \newcount\@medpenalty
5 \newcount\@highpenalty
```

*(End of definition for \@lowpenalty, \@medpenalty, and \@highpenalty.)*

```
\newmarks Allocate extended marks types if etex is active. Placed here at the end of the format to
increase compatibility with count allocations in earlier releases.
```

```
6 </2ekernel>
7 <*2ekernel | latexrelease>
8 <latexrelease>\IncludeInRelease{2015/01/01}%
9 <latexrelease> \newmarks}{Extended Allocation}%
10 \ifx\marks\@undefined\else
11 \def\newmarks{%
12 \e@alloc\marks \e@alloc@chardef{\count256}\m@ne\e@alloc@top}
13 \fi
14 </2ekernel | latexrelease>
15 <latexrelease>\EndIncludeInRelease
16 <latexrelease>\IncludeInRelease{0000/00/00}%
17 <latexrelease> \newmarks}{Extended Allocation}%
18 <latexrelease>\let\newmarks\@undefined
19 <latexrelease>\EndIncludeInRelease
20 <*2ekernel>
```

*(End of definition for \newmarks.)*

Allocate 3 mark classes to be used in `\markboth` and `\markright`. Should be done earlier but for that definition of `\newmarks` needs moving (which it should I guess).

```
21 </2ekernel>
22 <*2ekernel | latexrelease>
23 <latexrelease>\IncludeInRelease{2022/06/01}%
24 <latexrelease> {2e-left}{Delayed legacy marks}%
25 \NewMarkClass {2e-left}
```

```

26 \NewMarkClass {2e-right}
27 \NewMarkClass {2e-right-nonempty}

```

No rollback really, the marks will remain.

```

28 </2ekernel | latexrelease>
29 <latexrelease>\EndIncludeInRelease
30 <latexrelease>\IncludeInRelease{0000/00/00}%
31 <latexrelease> {2e-left}{Delayed legacy marks}%
32 <latexrelease>
33 <latexrelease>\EndIncludeInRelease
34 <*2ekernel>

```

```

\newXeTeXintercharclass Allocate \XeTeXintercharclass types if xetex is active. previously defined in xetex.ini.
\xe@alloc@intercharclass
\e@alloc@intercharclass@top

```

```

131 end
132 <latexrelease> if luatexbase.callbacktypes['input_level_string'] then
133 luatexbase.add_to_callback('input_level_string',
134 trace_stack_levels,'tracingstacklevels')
135 <latexrelease> end
136 }%
137 <*2ekernel>
138 }}%
139 </2ekernel>
140 \fi
141 <latexrelease>\EndIncludeInRelease
142 <latexrelease>

```

Then for the full rollback, just do nothing, since the function was already taken out of the rollback above.

```

143 <latexrelease>\IncludeInRelease{0000/00/00}{trace_stack_levels}%
144 <latexrelease> {Lua trace_stack_levels function}%
145 <latexrelease>% Nothing here
146 <latexrelease>\EndIncludeInRelease
147 </2ekernel | latexrelease>
148 <*2ekernel>

```

*(End of definition for trace\string\_stack\string\_levels.)*

The default values of the picture and \fbox parameters:

```

149 \unitlength = 1pt
150 \fboxsep = 3pt
151 \fboxrule = .4pt

```

The saved value of T<sub>E</sub>X's \maxdepth:

```

152 \@maxdepth = \maxdepth

```

\vsize initialized because a \clearpage with \vsize<\topskip causes trouble.  
 \@colroom and \@colht also initialized because \vsize may be set to them if a  
 \clearpage is done before the \begin{document}

```

153 \vsize = 1000pt
154 \@colroom = \vsize
155 \@colht = \vsize

```

Initialise \textheight \textwidth and page style, to avoid internal errors if they are not set by the class.

```

156 \textheight=.5\maxdimen
157 \textwidth=\textheight
158 \ps@empty

```

### 1.3 Lccodes for hyphenation

For 7- and 8-bit engines the assumption of T1 encodings is the basis for the hyphenation patterns. That's not the case for the Unicode engines, where the assumption is engine-native working. The common loader system provides access to data from the Unicode Consortium covering not only `\lccode` but also other related data. The `\lccode` part of that at least needs to be loaded before hyphenation is tackled: XeTeX follows the standard TeX route of building patterns into the format. LuaTeX doesn't require this data be loaded *here* but it does need to be loaded somewhere. Rather than test for the Unicode engines by name, the approach here is to look for the extended math mode handling both provide: any other engine developed in this area will presumably also provide `\Umathcode`.

```
159 \ifnum 0%
160 \ifx\Umathcode\@undefined\else 1\fi

223 <*2ekernel>

```

There is one over-ride that makes sense here (see below for the same for 8-bit engines): setting the lccode for - to itself.

```
224 \lccode'\- ='\- % default hyphen char
```

The alternative is that a “traditional” engine is in use.

```
225 \else
```

We set things up so that hyphenation files can assume that the default (T1) lccodes are in use (at present this also sets up the uccodes). We temporarily define `\reserved@a` to apply `\reserved@c` to all the numbers in the range of its arguments.

```

226 \def\reserved@a#1#2{%
227 \@tempcnta#1\relax
228 \@tempcntb#2\relax
229 \reserved@b
230 }
231 \def\reserved@b{%
232 \ifnum\@tempcnta>\@tempcntb\else
233 \reserved@c\@tempcnta
234 \advance\@tempcnta\@ne
235 \expandafter\reserved@b
236 \fi
237 }

```

Depending on the T<sub>E</sub>X version, we might not be allowed to do this for non-ASCII characters.

```

238 \def\reserved@c#1{%
239 \count@=#1\advance\count@ by -"20
240 \uccode#1=\count@
241 \lccode#1=#1
242 }

```

```

243 \reserved@a{'\a}{'\z}
244 \reserved@a{"A0}{\BC}
245 \reserved@a{"E0}{\FF}

```

The upper case characters need their `\uccode` and `\lccode` values set, and their `\sfcode` set to 999.

```

246 \def\reserved@c#1{%
247 \count@=#1\advance\count@ by "20
248 \uccode#1=#1
249 \lccode#1=\count@
250 \sfcode#1=999
251 }
252 \reserved@a{'\A}{'\Z}
253 \reserved@a{"80}{\9C}
254 \reserved@a{"C0}{\DF}

```

Well, it would be nice if that were correct, but unfortunately, the Cork encoding contains some odd slots whose `uccode` or `lccode` isn't quite what you'd expect.

```

255 \uccode'\^^Y='I % dotless i
256 \lccode'\^^Y='^^Y % dotless i
257 \uccode'\^^Z='J % dotless j, ae in OT1
258 \lccode'\^^Z='^^Z % dotless j, ae in OT1
259 \lccode'\^^9d='i % dotted I
260 \uccode'\^^9d='^^9d % dotted I
261 \lccode'\^^9e='^^9e % d-bar
262 \uccode'\^^9e='^^d0 % d-bar

```

Finally here is one that helps hyphenation in the OT1 encoding.

```

263 \lccode'\^^[='^^[% oe in OT1

```

And we also set the `\lccode` of `\-` and `\textcompwordmark` so that they do not prevent hyphenation in the remainder of the word (as suggested by Lars Helström).

```

264 \lccode'\- ='\' % default hyphen char
265 \lccode 127=127 % alternate hyphen char
266 \lccode 23 =23 % textcompwordmark in T1

```

End of the conditional to select either Unicode or T1 encoding defaults.

```

267 \fi

```

At this stage, we can install any last-minute `expl3` set-up.

```

268 \@expl@finalise@setup@@
269 \def\@expl@finalise@setup@@{}

```

This is as good a place as any to active a few XeTeX-specific settings

```

270 \ifx\XeTeXuseglyphmetrics\@undefined
271 \else

273 \XeTeXdashbreakstate=1 %
274 \fi

```

## 1.4 Hyphenation

The following code will be compiled into the format file. It checks for the existence of `hyphen.cfg` in inputs that file if found. Otherwise it inputs `hyphen.ltx`. Note that these are loaded in *before* the `\catcodes` are set, so local hyphenation files can use 8-bit input.

We try to load the customized hyphenation description file.

```

275 \InputIfFileExists{hyphen.cfg}
276 {\typeout{=====^J%
277 Local configuration file hyphen.cfg used^J%
278 =====}%

## 1.6 Input encoding

Starting with the 2018 L<sup>A</sup>T<sub>E</sub>X release default the inputencoding to UTF-8. Unless the format is being used with luatex, xetex, enc<sub>te</sub>x or ml<sub>te</sub>x.

This is done in a way largely compatible with older releases: `utf8.def` is input just as if

```
\usepackage[utf8]{inputenc}
```

had been used, however rather than input the whole package a minimal core part just enough to support loading the UTF-8 encoding files is defined here.

If a document re-specifies UTF-8 this is silently ignored.

```

346 </2ekernel>
347 <*2ekernel | latexrelease>

```

Check that a classic 8-bit tex engine is being used (LaTeX or PDFLaTeX).

```

```

All the characters in the range 0–31 and 127–255 are illegal, *except* `tab` (`^^I`), `nl` (`^^J`), `ff` (`^^L`) and `cr` (`^^M`).

## 1.7 Lccodes and uccodes

We now again set up the default (T1) uc/lccodes. The lower case characters need their `\uccode` and `\lccode` values set. Some of this is a repeat of the set-up before loading hyphenation files. Depending on the T<sub>E</sub>X version, we might not be allowed to do this for non-ASCII characters. For the Unicode engines (XeT<sub>E</sub>X and LuaT<sub>E</sub>X) there is no need to do any of this: they use hyphenation data which does not alter any of the set up and so this entire block is skipped.

```

551 }
552 \reserved@a{'\A}{'\Z}
553 \reserved@a{"80}{'9C}
554 \reserved@a{"C0}{'DF}

```

Well, it would be nice if that were correct, but unfortunately, the Cork encoding contains some odd slots whose uccode or lccode isn't quite what you'd expect.

```

555 \uccode'\^^Y='^I % dotless i
556 \lccode'\^^Y='^^Y % dotless i
557 \uccode'\^^Z='^J % dotless j, ae in OT1
558 \lccode'\^^Z='^^Z % dotless j, ae in OT1
559 \lccode'\^^9d='^i % dotted I
560 \uccode'\^^9d='^^9d % dotted I
561 \lccode'\^^9e='^^9e % d-bar
562 \uccode'\^^9e='^^d0 % d-bar

```

Finally here is one that helps hyphenation in the OT1 encoding.

```

563 \lccode'\^^[='^^[% oe in OT1
564 \fi % End of reset block for 8-bit engines

```

`\BCPdata` A stub for use by babel, polyglossia, etc.

```

565 \ExplSyntaxOn
566 \newcommand*\BCPdata[1]{
567 \str_case:nn {#1}
568 {
569 { language } { en }

```

```

570 { region } { US }
571 { script } { Latn }
572 { tag } { en-US }
573 }
574 }
575 \ExplSyntaxOff

```

(End of definition for \BCPdata.)

\MakeUppercase And whilst we're doing things with uc/lc tables, here are two commands to upper- and lower-case a string.

\MakeLowercase Wrappers around the L3 case changing functions. \protected to make them mostly safe as replacements for uppercase and \lowercase.

\MakeTitlecase In

\NoCaseChange

\AddToNoCaseChangeList

\CaseSwitch

\DeclareCaseChangeEquivalent

\DeclareLowercaseMapping

\DeclareTitlecaseMapping

\DeclareUppercaseMapping

\@uclclist

```

\markboth{\MakeUppercase\contentsname}
{\MakeUppercase\contentsname}

```

then the uppercasing is only done to the first letter of the contents name, since the mark expands out to:

```

\mark{\MakeUppercase Table of Contents}
{\MakeUppercase Table of Contents}

```

In order to get round this, we redefine \MakeUppercase and \MakeLowercase to grab their argument and brace it.

Earlier versions needed to process \@uclclist in an \edef to handle legacy input encodings, but recent (2022) expl3 versions handle non-UTF8 text natively so we simply call the \text\_...case:n functions.

```

576 \ExplSyntaxOn
577 \keys_define:nn { __kernel }
578 {
579 lang .str_set:N = \reserved@a ,
580 locale .str_set:N = \reserved@a
581 }
582 \cs_new_protected:Npn @@text@case@aux #1#2#3
583 {
584 \cs_set_nopar:Npn \reserved@a { }
585 \tl_if_blank:nTF {#2}
586 {
587 \str_set:Nx \reserved@a
588 { \BCPdata { casing } }
589 \str_if_empty:NT \reserved@a
590 {
591 \str_set:Nx \reserved@a
592 { \BCPdata { language } }
593 }
594 }
595 { \keys_set:nn { __kernel } {#2} }
596 \use:c { text_ #1 case:Vn } \reserved@a {#3}
597 }

```

The odd use of *three* spaces here is needed as `ltxcmd` uses the name with one and two spaces to give a ‘friendly’ error message for a runaway argument: that means we can’t use it here.

```

598 \exp_args_generate:n { cnx }
599 \cs_set_protected:Npn \reserved@a #1
600 {
601 \cs_generate_variant:cn { text_ \str_lowercase:n {#1} case:nn } { V }
602 \ExpandArgs { cnx } \NewExpandableDocumentCommand
603 { Make#1case }
604 { 0{ } +m }
605 { \exp_not:c { Make#1case \c_space_tl \c_space_tl \c_space_tl } [####1] {####2} }
606 }
607 \reserved@a { Upper }
608 \reserved@a { Lower }
609 \reserved@a { Title }

```

Currently, `babel` uses the equivalence of `\oe` and `\OE` to force casing of some material, most notably in `\today`. To enable that to work, we have to set those commands equal even though the current case changing code does not work using this approach.

```

610 \cs_new_protected:cpn { MakeLowercase \c_space_tl \c_space_tl \c_space_tl } [1] #2
611 {{
612 \let \OE \oe
613 \@@text@case@aux { lower } {#1} {#2}
614 }}
615 \cs_new_protected:cpn { MakeUppercase \c_space_tl \c_space_tl \c_space_tl } [1] #2
616 {{
617 \let \oe \OE
618 \@@text@case@aux { upper } {#1} {#2}
619 }}
620 \cs_new_protected:cpn { MakeTitlecase \c_space_tl \c_space_tl \c_space_tl } [1] #2
621 {{
622 \let \oe \OE
623 \@@text@case@aux { title } {#1} {#2}
624 }}

```

`\NoCaseChange` protects its argument from the case change functions.

`\AddToNoCaseChangeList` Allows new commands to protect their arguments, eg `\AddToNoCaseChangeList{\eqref}` would protect the argument of `\eqref` in the same way as the argument of `\ref`.

```

625 \cs_new_protected_nopar:Npn \AddToNoCaseChangeList
626 {\tl_put_right:Nn \l_text_case_exclude_arg_tl}
627 \AddToNoCaseChangeList{ \NoCaseChange }

655 \dh\DH\dj\DJ\l\L\ng\NG\ss\SS\ij\IJ\th\TH}

```

## 1.8 Applying Patch files

Patch file code removed.

The code below adds the ‘patch level’ string to the first `\typeout` in the startup banner.

`\@filelist` Reset `\@filelist` so files input while making the format are not listed. The list built up so far may take up a lot of memory and so it is moved to `\reserved@a` where it will be overwritten as soon as almost any L<sup>A</sup>T<sub>E</sub>X command is issued in a class file. However the `latexbug.tex` program will be able to access this information and insert it into a bug report.

```

713 \let\@filelist\@gobble
714 \def\@addtofilelist#1{\xdef\@filelist{\@filelist,#1}}%

```

*(End of definition for \@filelist and \@addtofilelist.)*

## 1.11 Preparation for supporting PDF in backends

At the current point in time, basic support for PDF in backends is not part of L<sup>A</sup>T<sub>E</sub>X core; it is provided by external packages. At some time in the future that work will be placed into the kernel but for now it is separate and has to be explicitly loaded in the document.

In that code there is a command `\IfPDFManagementActiveTF` which can be used by packages in order to execute different code depending on the whether this basic backend support is loaded.

To make this also work properly when this external package is not loaded at all, we here add this command already in the kernel (with a trivial definition); thus any package can query this loading state in all circumstances. Once this basic PDF backend support gets moved to the kernel, this definition will vanish again from here or, rather, it will be replaced by a real test.

`\IfPDFManagementActiveTF` So long as the code for the basic backend support for PDF is not loaded, the test that is implicit here will always return the false branch. Once this code is loaded, this definition will get replaced by a real test (as it is then possible that the management code is either activated or not activated).

```

715 \let \IfPDFManagementActiveTF \@secondoftwo

```

*(End of definition for \IfPDFManagementActiveTF.)*

## 1.12 Do some temporary work for pre-release

This is a good place to load code that hasn't yet been integrated into the other files ...

## 1.13 Some last minute initializations ...

Load the first aid set of definitions for external packages that await updates.

```

716 \@input{latex2e-first-aid-for-external-files.ltx}

```

## 1.14 Dumping the format

Finally we make `@` into a letter, ensure the format will be in the 'normal' error mode, and dump everything into the format file.

```

717 \makeatother
718 \errorstopmode
719 \dump
720 </2ekernel>

```

- Removed optional argument of `\item` ..... 716
- `center`: Removed optional argument of `\item` ..... 713
- `flushleft`: Removed optional argument of `\item` ..... 714
- `flushright`: Removed optional argument of `\item` ..... 715
- 1993-12-13 ltoutenc.dtx v1.2b
  - General: Corrected file name in driver code. .... 417
- 1993-12-13 lttab.dtx latex2e
  - `\tabbing`: Removed optional argument of `\item` ..... 780
- 1993-12-14 ltoutput.dtx v1.0i
  - General: Section added to declare all parameters ..... 1086
- 1993-12-15 ltboxes.dtx v0.1d
  - `\iminipage`: Changed default from ‘c’ to ‘s’ ..... 767
  - `\iparbox`: Changed default from ‘c’ to ‘s’ ..... 764
  - `\minipage`: Changed default from ‘c’ to ‘s’ ..... 767
  - extra space removed. .... 767
  - `\parbox`: Changed default from ‘c’ to ‘s’ ..... 764
- 1993-12-15 ltclass.dtx v0.2p
  - General: Removed extra ‘s from `\@warnings` ..... 909
- 1993-12-16 ltlogos.dtx LaTeX2e
  - `\LaTeXe`: Extended logo by DPC .. 393
- 1993-12-16 ltmath.dtx v0.9i
  - `\@eqnocr`: use `\refstepcounter` instead of shortcut ..... 734
  - General: use `\refstepcounter` instead of shortcut ..... 733
- 1993-12-16 ltmiscen.dtx v0.9i
  - General: `\literal` added ..... 722
- 1993-12-16 ltpage.dtx LaTeX2e
  - `\mark`: Init `\mark` at begin document 903
- 1993-12-16 ltspac.dtx LaTeX2e
  - `\bsphack`: Corrected optimisation :-) 380
- 1993-12-16 lttab.dtx latex2e
  - `\xhline`: Measure from middle of vertical rules ..... 795
- 1993-12-17 ltclass.dtx v0.2q
  - `\@documentclasshook`: Macro added 909
  - `\@fileswithoptions`: Add `\@compatibility` hook ..... 928
  - `\documentstyle`: Match Alan’s new code. .... 925
- 1993-12-17 ltoutenc.dtx 1.3
  - General: Added this section ..... 421
- Removed all the hackery for use in `\DeclareFontEncoding`, and redid everything using `\DeclareTextFoo`. .... 433, 435
- Removed the catcode hackery, since the file is only read as a package in the preamble, and removed all the messages on the screen, which just confuse users. Replaced them by the appropriate `\ProvidesPackage` commands. Added XXXenc. ... 420
- 1993-12-17 ltoutenc.dtx v1.3
  - General: Added `\EncodingSpecificAccent`, `\EncodingSpecificAccentedLetter` and `\EncodingSpecificCommand`. 417
  - Made Rokicki’s encoding a proper encoding scheme rather than a variant of OT1. .... 417
- 1993-12-17 ltoutput.dtx v1.0j
  - `\@opcol`: Hook removed ..... 1038
  - `\@specialoutput`: Page room test added ..... 1033
  - `\@topnewpage`: check for vsize too small added ..... 1030
  - Page room test added ..... 1032
  - `\@writsetup`: —and then removed 1042
  - `\fl@tracemessage`: tracefloatvals made a document command .. 1074
- 1993-12-17 ltpage.dtx LaTeX2e
  - `\mark`: Removed init `\mark` at begin document, since it doesn’t work. 903
  - `\rightmark`: Stopgap solution to mark `\leftmark` and `\rightmark` work without initializing mark until the problem is solved. .... 903
- 1993-12-18 ltoutenc.dtx 1.3b
  - General: Fixed typos with `\ProvidesPackage` lines. Added the `\NeedsTeXFormat` line. Added the last argument to `\DeclareEncoding`. Moved the use of the encodings to after their declaration. .... 420
  - Replaced the missing last argument to `\DeclareFontEncoding`. 433, 435
- 1993-12-18 ltoutenc.dtx 1.3c
  - General: Rewrote for the new syntax of `\EncodingSpecific`. ... 433, 435
  - Split `\EncodingSpecificAccent` up into `\EncodingSpecific` and `\DeclareAccent`. .... 421
- 1993-12-18 ltoutenc.dtx v1.3a
  - General: Replaced OT3 by XXX .. 417

- Rewrote for the new syntax. . 433, 435
- 1994-05-01 ltoutenc.dtx v1.4a  
General: Removed Rokicki's encoding. . . . . 417  
Renamed the commands, removed the `\EncodingSpecific` command.  
Turned all slots into decimal.  
Added `\a`. . . . . 417
- 1994-05-02 ltcntrl.dtx v1.0l  
`\@break@tfor`: Macro added (from ltfiles.dtx) . . . . . 340
- 1994-05-02 ltdefs.dtx v1.1f  
`\renewcommand`: Removed surplus  
`\space` in error . . . . . 87  
`\renewenvironment`: Removed surplus  
`\space` in error . . . . . 88
- 1994-05-02 ltfiles.dtx v1.0f  
`\iffilenamepath`: `\@break@loop` renamed to `\@break@tfor` . . . . 411  
`\@obsoletefile`: Make  
`\@onlypreamble` . . . . . 415
- 1994-05-02 ltfinal.dtx v0.1e  
General: Added setting the 'letter' catcodes. . . . . 1103  
Added setting the 'other' catcodes. . . . . 1103  
Added setting the special catcodes. . . . . 1103  
Made slot 127 illegal . . . . . 1103  
Set all the catcodes . . . . . 1091
- 1994-05-02 ltfinal.dtx v0.1f  
General: Set the catcode of control-J. . . . . 1103
- 1994-05-02 ltmiscen.dtx v1.0g  
General: Changed 91 to 1991 and moved some bits . . . . . 699
- 1994-05-02 ltoutput.dtx v1.0o  
`\@resethfps`: Code shortened . . . . 1078  
General: Code of `\@resethfps` shortened. . . . . 1015
- 1994-05-03 ltbibl.dtx v1.0b  
`\nocite`: Make `\nocite` issue a warning for an undefined citation key. . . . . 876
- 1994-05-03 ltfinal.dtx v0.1f  
General: Set the catcode of control-J to be 'other', for use in messages. 1091
- 1994-05-03 ltfloat.dtx v1.0f  
General: (CAR) Added  
`\@largefloatcheck` . . . . . 847  
Removed unnecessary braces from arguments of `\@ifnextchar` . . . . 847  
`\end@dblfloat`: `\@largefloatcheck` added . . . . . 855
- `\end@float`: (CAR) Added  
`\@largefloatcheck` . . . . . 854
- 1994-05-03 ltssdcl.dtx v2.1f  
General: Renamed  
`\@DeclareMathDelimiter` to  
`\@DeclareMathDelimiter` . . . . 552
- 1994-05-03 ltlists.dtx v1.0d  
`\@item`: `\hskip` changed to `\kern` . . 751  
`\item`: Removed superfluous braces 750
- 1994-05-03 ltmiscen.dtx v1.0h  
`\@centercr`: `\@badcrerr` replaced by  
`\@nolnerr` . . . . . 712
- 1994-05-03 lttab.dtx v1.0d  
`\@endpbox`: Use `\@finalstrut` based on depth of `\@arstrutbox` . . . . 796
- 1994-05-04 ltclass.dtx v1.0b  
`\NeedsTeXFormat`: Changed wording of the warning . . . . . 927
- 1994-05-04 lterror.dtx v1.0m  
`\@badcrerr`: Error message removed 350
- 1994-05-05 ltbibl.dtx v1.0c  
`\@citex`: Set switch for warning and end of run. . . . . 875  
`\nocite`: Do not write page number in `\nocite` warning message. . . . . 876  
Set switch for warning and end of run. . . . . 876
- 1994-05-05 ltfinal.dtx v0.1g  
General: Added empty errhelp. . . . 1091  
`\errhelp`: Set error help empty. . . 1108
- 1994-05-05 ltfntcmd.dtx v3.3c  
`\@math@egroup`: Corrected  
`\@fontswitch` and added saved versions . . . . . 643  
General: Corrected `\@fontswitch` . . 636
- 1994-05-05 ltmiscen.dtx v1.0i  
General: Removed braces from `\ifnextchar` and `\ifstar` arguments . 699
- 1994-05-07 lttab.dtx v1.0c  
`\@maxtab`: Changed `\@firsttab` to  
`\chardef` . . . . . 777  
Changed `\@maxtab` to `\chardef` . . 777  
General: Removed definition of `\+` . 773  
Removed surplus braces from  
`\@ifnextchar` constructs . . . . . 773
- 1994-05-08 ltfntcmd.dtx v3.3d  
General: Removed  
`\@undefinedfonterror` . . . . . 636  
`\normalsize`: Removed  
`\@undefinedfonterror` . . . . . 644
- 1994-05-09 ltfntcmd.dtx v3.3f  
General: Replaced all `\next` by  
`\@let@token` and undo change 3.3e, whatever that was. . . . . 636

|                                                              |     |                                                           |     |

| 1994-05-13 ltdefns.dtx v1.0s                                 |          | <code>\@if..</code> constructions . . . . .                                   | 798  |
| General: (ASAJ) Added                                        |          | 1994-05-13 lttab.dtx v1.0d                                                    |      |
| <code>\@backslashchar</code> . . . . .                       | 81       | <code>\@contfield</code> : Colour support . . . . .                           | 779  |
| (ASAJ) Coded <code>\@ifdefinable</code> more                 |          | <code>\@startfield</code> : Colour support . . . .                            | 779  |
| efficiently. . . . .                                         | 81       | <code>\@stopfield</code> : Colour support . . . . .                           | 779  |
| Coded more efficiently, thanks to                            |          | <code>\a</code> : moved to ltoutenc . . . . .                                 | 777  |
| FMi. . . . .                                                 | 87       | 1994-05-14 fontdef.dtx v2.1f                                                  |      |
| 1994-05-13 ltfiles.dtx LaTeX2e                               |          | General: Removed .def files. . . . .                                          | 614  |
| <code>\listfiles</code> : Stop <code>\listfiles</code> being |          | 1994-05-14 ltfsbas.dtx v2.1m                                                  |      |
| run twice . . . . .                                          | 415      | <code>\enc@update</code> : Macro added . . . . .                              | 482  |

- 1994-05-14 ltffssbas.dtx v2.1n  
 General: Set defaults for all `\f@...` 483  
`\DeclareErrorFont`: Don't set  
`\f@encoding` 491  
`\DeclareFontEncoding`: Log if  
 encoding is redeclared 477  
 Only init enc change cmd when new  
 encoding 477
- 1994-05-14 ltffssini.dtx v2.1k  
 General: Init error font just before  
 checking for fontdef.cfg 609  
`\reset@font`: Remove surplus braces 607
- 1994-05-14 ltfsstrc.dtx v2.3h  
`\selectfont`: Added `\enc@update` 528
- 1994-05-14 ltoutenc.dtx 1.5d  
 General: Moved the driver to the top. 420
- 1994-05-14 ltoutenc.dtx v1.5c  
 General: Added the fontenc package 460  
 Added the fontenc package. 417  
 Fixed a bug which caused an  
 infinite loop if `\f@encoding` was  
 incorrectly set. 417, 421  
 Moved fontsmpl to its own dtx file. 417
- 1994-05-14 ltoutenc.dtx v1.5d  
 General: Rewrote  
`\DeclareTextCommand` to define its  
 argument to use the current  
 encoding by default, rather than  
 the encoding provided to  
`\DeclareTextCommand`. 417, 421  
 Tidied up the documentation. 417
- 1994-05-14 ltoutenc.dtx v1.5e  
 General: Replaced `\ENC@cmd` by  
`\ENC-cmd`. 417
- 1994-05-15 ltffssbas.dtx v2.1o  
 General: encoding cmds changed to  
 enc-cmd 473
- 1994-05-16 fontdef.dtx v2.1g  
 General: Removed  
`\DeclareFontEncoding` for ot1 and  
 t1 and input .def files instead 614
- 1994-05-16 ltalloc.dtx v1.1a  
 General: (ASAJ) Split from ltinit.dtx. 335
- 1994-05-16 ltcntrl.dtx v1.0a  
 General: (ASAJ) Split from ltinit.dtx. 337
- 1994-05-16 ltdefns.dtx v1.1a  
 General: (ASAJ) Split from ltinit.dtx. 81
- 1994-05-16 lterror.dtx v1.1a  
 General: (ASAJ) Completely new  
 error interface. 341  
 (ASAJ) Split from ltinit.dtx. 341
- 1994-05-16 ltfinal.dtx v1.0i  
 General: moved output enc stuff to  
 lfonts 1107
- 1994-05-16 ltffssbas.dtx v2.1p  
`\fontsize`: Pass `\baselinestretch` not  
`\f@linespread` 483  
`\linespread`: Remove surplus braces 483
- 1994-05-16 ltffssini.dtx v2.1m  
`\@acciii`: Define saved versions of  
 accents 610
- 1994-05-16 ltlogos.dtx v1.1a  
 General: (ASAJ) Split from ltinit.dtx. 393
- 1994-05-16 ltmath.dtx v1.0k  
`\ensuremath`: Use  
`\DeclareRobustCommand` and add  
 extra braces in math mode 735
- 1994-05-16 ltoutenc.dtx 1.5h  
 General: `\pounds` was still using u  
 rather than ui shape. 433
- 1994-05-16 ltoutenc.dtx v1.5f  
 General: enc files now have uc  
 encoding name parts (FMi) 417  
 Revert code so that the encoding  
 given is used in  
`\DeclareTextCommand` (FMi) 417
- 1994-05-16 ltoutenc.dtx v1.5g  
 General: Made fontenc.sty use the new  
 mixed-case encoding files. 417  
 Removed the lowercasing of the  
 filename. 460
- 1994-05-16 ltoutenc.dtx v1.5h  
 General: Added `\NG`, `\ng`, `\TH`, `\th`,  
`\DH`, `\dh`, `\DJ` and `\dj`. 417  
 Added `\r` (ring accent) and `\k`  
 (ogonek) accents. 417  
 Fixed a bug with `\pounds`. 417  
 Removed `\P` from the OT1  
 definitions file. 417
- 1994-05-16 ltoutenc.dtx v1.5i  
 General: Fixed a bug with `\d`. 417
- 1994-05-16 ltoutput.dtx v1.0q  
`\@writsetup`: Changed setting of  
 accents (FMi): with the new  
 encoding setup they can use `\let`.  
 It could also use the new internal  
 commands? 1043  
 General: Changed setting of accents  
 (FMi). 1015
- 1994-05-16 ltpar.dtx v1.1a  
 General: (ASAJ) Split from ltinit.dtx. 352
- 1994-05-16 ltplain.dtx v1.0h  
 General: Comment out encoding  
 specific commands 32  
 Remove `\@acci` and friends again 33  
 Remove unnecessary def for `\item` 32  
`\loop`: Use Kabelschacht method 30  
`\m@th`: Remove unnecessary space 32

- 1994-05-16 ltspace.dtx v1.1a  
General: (ASAJ) Split from ltinit.dtx. 373
- 1994-05-17 ltclass.dtx v1.0e  
`\@use@option`: Execute option after removing from list, not before .. 924
- 1994-05-17 ltdefs.dtx 1.1b  
General: (ASAJ) Added the `\@protect@...` commands. .... 91
- 1994-05-17 ltdefs.dtx v1.1b  
General: (ASAJ) Added definitions for `protect`. .... 81  
(ASAJ) Removed warnings and logging to `lterror.dtx`. .... 81  
Added the discussion of protected commands, defined the values that `\protect` should have. .... 91
- 1994-05-17 ltdefs.dtx v1.1c  
General: (ASAJ) Redid definitions for `protect`. .... 81
- 1994-05-17 lterror.dtx v1.1b  
General: (ASAJ) Moved error stuff from `ltdefs.dtx`. .... 341
- 1994-05-17 ltfssini.dtx v2.1n  
`\copyright`: Really add extra braces 607  
`\nfss@text`: Added braces to allow use in subscripts .... 607
- 1994-05-17 ltmath.dtx v1.0i  
General: Replaced `\let` by `\gdef`, for indirect definition. .... 730
- 1994-05-17 ltoutenc.dtx v1.5j  
General: Added braces to `\pounds` so it works as a subscript. .... 417
- 1994-05-18 ltdefs.dtx 1.1c  
General: (ASAJ) Renamed the commands, and removed one which is no longer needed. .... 91
- 1994-05-18 ltdefs.dtx v1.1c  
General: Redid the discussion and definitions, in line with the proposed new setting of `\protect` in the output routine. .... 91
- 1994-05-18 ltfinal.dtx v0.1j  
General: Corrected the `lccode` for `d-bar`. .... 1091
- 1994-05-18 ltlogos.dtx v1.1b  
General: (ASAJ) Added the  $\mathrm{T}_{\mathrm{E}}\mathrm{X}$  logo. .... 393  
(ASAJ) Made the  $\mathrm{L}^{\mathrm{A}}\mathrm{T}_{\mathrm{E}}\mathrm{X} 2_{\epsilon}$  logo use the text font ‘2’ rather than the math font ‘2’. .... 393
- 1994-05-18 ltoutenc.dtx v1.5k  
General: Made dotted-i produce ‘i’. . 417  
Removed braces from `\pounds` and `\dollar`. .... 417
- Replaced `\defaultencoding` with `\encodingdefault`. .... 417
- 1994-05-19 ltbibl.dtx v1.1a  
General: Initial version of `ltbibl.dtx`, split from `ltxbib.dtx`. .... 873
- 1994-05-19 ltcounts.dtx v1.1a  
General: Extracted file from `lctntlen`. 463
- 1994-05-19 ltdefs.dtx v1.1d  
General: (RmS) Added definitions for `\@namedef` and `\@nameuse` again. . 81
- 1994-05-19 ltfinal.dtx v0.1k  
General: Removed `\makeat...` . . . 1091
- 1994-05-19 ltxglo.dtx v1.1a  
General: Initial version of `ltxglo.dtx`, split from `ltxbib.dtx`. .... 870
- 1994-05-19 ltlength.dtx v1.1a  
General: Extract file `ltnlength` from `lctntlen`. .... 471
- 1994-05-19 ltpageno.dtx v1.1a  
General: Extract file `ltpageno` from `lctntlen`. .... 677
- 1994-05-19 ltplain.dtx v0.1k ltfinal  
`\showoutput`: used `\maxdimen` not 99999 .... 34  
`\showoverfull`: used `\@ne` not 1 .... 34
- 1994-05-19 ltxref.dtx v1.1a  
General: Extract file `ltxref` from `lctntlen`. .... 678
- 1994-05-20 ltdefs.dtx v1.1e  
General: Changed command name from `\@checkcommand` to `\CheckCommand`. .... 81  
`\CheckCommand`: Changed name from `\@checkcommand` to `\CheckCommand`. .... 89
- 1994-05-20 lterror.dtx v1.1c  
General: (ASAJ) Added `\@latex@info@no@line`. .... 341  
(ASAJ) Added missing full stops. 341  
(ASAJ) Fixed a bug with `\@inmatherr`. .... 341
- 1994-05-20 ltfinal.dtx v0.1l  
General: Use new font warning commands .... 1098
- 1994-05-20 ltfloat.dtx v1.0h  
`\@endfloatbox`: Restore outer value of `@nobreak` switch. .... 856  
`\outer@nobreak`: Macro added: default is to do nothing. .... 856
- 1994-05-20 ltfntcmd.dtx v3.3h  
General: Use new error commands . 636
- 1994-05-20 ltfssbas.dtx v2.1q  
General: Use new error commands . 473

- `\DeclareTextSymbol` to define its argument to use the current encoding by default, to fit with `\DeclareTextCommand`. . . . . 421
- 1994-10-27 ltoutenc.dtx v1.6b
  - General: Added `\textbackslash`. . . 441
  - Added more defaults for OT1. . . 429
  - Removed the enc.def files . . . . . 417
  - Removed the files OT1enc.def, T1enc.def and OMSenc.def. . . . 429
  - Renamed `\textlbrace` to `\textbraceleft` and `\textrbrace` to `\textbraceright`. . . . . 441
- 1994-10-29 ltmath.dtx 1.0m
  - General: ASAJ: Added `\DeclareMathOperator`. . . . . 723
  - ASAJ: Tidied up documentation. 731
- 1994-10-29 ltmath.dtx v1.0m
  - General: ASAJ: Added `\mathellipsis`, `\mathdollar` and `\mathsterling`. . . . . 730
  - ASAJ: Removed `\dag`, `\ddag`. . . 730
  - ASAJ: Renamed `\S` and `\P` to `\mathsection` and `\mathparagraph` and made them `\mathchardefs`. . . . . 730
- 1994-10-29 ltoutenc.dtx v1.6c
  - General: Added commands like `\dots` for use in text and math. . . . . 429
  - Renamed `\P`, `\S`, `\dag` and `\ddag` to `\textparagraph`, `\textsection`, `\textdagger` and `\textdaggerdbl`. . . . . 417
- 1994-10-30 ltdefns.dtx v1.2c
  - `\@onelevel@sanitize`: Macro added 110
  - General: (CAR)`\@onelevel@sanitize` added . . . . . 81
- 1994-10-30 ltdefns.dtx v1.2f
  - General: (DPC)`\newwrite`'s moved to ltfiles . . . . . 81
- 1994-10-30 ltmath.dtx v1.0n
  - General: ASAJ: Moved the new commands to ltoutenc. . . . . 730
- 1994-10-30 ltoutenc.dtx v1.6d
  - General: Added `\DeclareTextCompositeCommand`. 417
  - Added `\textcircled`. . 417, 431, 441
  - Added `\t`. . . . . 431
  - Added math commands. . . . . 417
  - Added OML encoding. . . . . 417, 431
  - Added the OML encoding. . . . . 442
  - Made `\textless` and `\textgreater` come from OML. . . . . 431
- Moved math commands here from ltmath. . . . . 433
- Removed `\textregistered`. . . . 431
- Rewrote `\copyright` to use `\textcircled`. . . . . 431
- 1994-10-31 fontdef.dtx v2.2d
  - General: Added OMLenc.def ... . . 614
- 1994-10-31 fontdef.dtx v2.2e
  - General: ... and moved further down 614
- 1994-10-31 ltfloat.dtx v1.1a
  - `\@dblfloat`: Major changes since two-column and one-column cases merged . . . . . 850
  - `\@dblfloatset`: Macro added . . . . . 850
  - Major changes to parameter parsing, setting of local variables, etc; two-column and one-column cases merged; space hacks moved 850
  - `\@endfloatbox`: (DPC/CAR) Extra box added to remove colour resetting from vmode . . . . . 856
  - `\@floatboxreset`: Macro added . . 854
  - `\@footnotetext`: (DPC/CAR) Move colour setting to output routine . 866
  - `\@savemarbox`: (DPC/CAR) Extra box added for colour . . . . . 860
  - `\@setfps`: Macro added . . . . . 851
  - `\@xdblfloat`: Macros removed: `\@dbflt`, `\@xdblfloat` . . . . . 856
  - `\@xfloat`: (DPC/CAR) Extra box added to remove colour resetting from vmode . . . . . 852
  - Major changes, removing setting of local variables, space hacks etc; two-column and one-column cases merged . . . . . 851
  - Reset hook added . . . . . 852
  - `\@xympar`: (DPC/CAR) Extra box added since needed for floats . . 861
  - `\fps@dbl`: Macro added . . . . . 851
- 1994-10-31 ltoutput.dtx v1.1a
  - `\@makecol`: (DPC/CAR) Colour resetting moved to here . . . . . 1039
  - `\@topnewpage`: (DPC/CAR) Extra box added to remove colour resetting from vmode . . . . . 1031
  - (DPC/CAR) Use `\color@begingroup` for colour . 1031
  - (DPC/CAR) Use `\normalcolor` 1031
- 1994-11-02 ltoutenc.dtx v1.6d
  - General: Wrapped lines longer than 70 characters. . . . . 417

 General: Added `\leavevmode` at start of `\c`, otherwise the output routine might be invoked within the macro. . . . . 433  
 Changed `\char32` to `\xxxii` (two tokens less). . . . . 434  
 Replaced octal number 27 by decimal number 23 to protect against the quote character being active. . . . . 434  
 Replaced some 0's by `\z@` (faster). 434
- 1995-11-10 ltoutput.dtx v1.1s  
`\@shipoutsetup`: Command removed . . . . . 1042  
`\@writesetup`: Command removed 1042  
 In-lined . . . . . 1042
- 1995-11-14 ltclass.dtx v1.0t  
`\@@unprocessedoptions`: Allow empty option . . . . . 938  
`\@loadwithoptions`: macro added . 926  
`\LoadClassWithOptions`: macro added . . . . . 926  
`\RequirePackageWithOptions`: macro added . . . . . 926
- 1995-11-17 ltfssbas.dtx v3.0m  
`\@wrong@font@char`: (DPC) Macro added. latex/1676 . . . . . 493  
`\define@newfont`: Redefine `\typeout` latex/1676 . . . . . 487  
`\wrong@fontshape`: Support `\@wrong@font@char` latex/1676 . 492
- 1995-11-17 ltoutenc.dtx v1.7p  
`\UseTextSymbol`: Support `\@wrong@font@char` latex/1676 . 426
- 1995-11-18 ltoutenc.dtx v1.7q  
`\UseTextSymbol`: Modify message slightly . . . . . 426
- 1995-11-21 fontdef.dtx v2.2n  
 General: Incorporate changed figures, as in plain.tex . . . . . 628
- 1995-11-27 ltfssbas.dtx v3.0n  
`\nfss@catcodes`: Reset hash, for definitions in fd files . . . . . 488
- 1995-11-28 ltfloat.dtx v1.1n  
 General: documentation fixes . . . . 847
- 1995-11-28 ltfsssrc.dtx v3.0g  
 General: documentation fixes . . . . 522
- 1995-11-28 ltoutenc.dtx v1.7r  
 General: Added math mode checks to text commands. . . . . 421  
 doc fixes . . . . . 417  
 Renamed `\@changed@x@err` to `\TextSymbolUnavailable`. . . . . 421
- 1995-11-29 ltoutenc.dtx v1.7t  
 General: Added `\textasciicircum`, `\textasciitilde`, `\textbackslash`, `\textbar`, `\textgreater` and `\textless`. . . 437  
 Added `\textasciicircum`, `\textasciitilde`, `\textregistered` and `\texttrademark`. . . . . 431  
 Added `\textbackslash` and `\textbar`. . . . . 430, 441  
 Added `\textless` and `\textgreater`. . . . . 431, 442
- 1995-12-01 ltoutenc.dtx v1.7u  
 General: Made `\SS` a Default, rather than having the default point to the OT1 definition. . . . . 431
- 1995-12-04 ltspace.dtx v1.2k  
`\nobreakspace`: (Macro added) . . . . 389
- 1995-12-04 ltspace.dtx v1.2l  
`\xobeysp`: (braces added to definition of tilde) . . . . . 389
- 1995-12-04 preload.dtx v2.4e  
 General: Ulrik Vieth. added 12pt OMS and OML preloads /1989 . 635
- 1995-12-05 ltdefs.dtx 1.2w  
`\unexpandable@protect`: Removed `\unexpandable@noexpand` as never used. internal/1733 . . . . . 91
- 1995-12-05 ltfiles.dtx v1.1c  
`\document`: `\ignorespaces` added for latex/1933 . . . . . 398
- 1995-12-05 ltfloat.dtx v1.1n  
`\@textsuperscript`: Use `\ensuremath` for latex/1984. . . . . 865
- 1995-12-05 ltoutenc.dtx v1.7v  
`\@inmathwarn`: Changed `\TextSymbolUnavailable` text . . 422
- 1995-12-06 ltfssbas.dtx v3.00  
`\nfss@catcodes`: Reset hat, for typeouts etc in fd files . . . . . 488
- 1995-12-07 ltbibl.dtx v1.1l  
`\@citex`: Restored name of `\G@refundefinedtrue` . . . . . 875
- 1995-12-07 ltfloat.dtx v1.1m  
`\@textsuperscript`: Move `\m@th` out of the `\ensuremath` for latex/1984. . . . . 865
- 1995-12-07 ltxref.dtx v1.1i  
`\@setref`: Switch for `\refundefined` restored . . . . . 680  
`\G@refundefinedtrue`: Renamed (back) from `\G@refundefined` . . 679

- 1996-10-26 ltlists.dtx v1.0o  
`\endtrivlist`: Correct typo . . . . . 748
- 1996-10-27 ltoutenc.dtx v1.8c  
`\@strip@args`: Removed macro . . . 424  
General: Added `\r A` . . . . . 434  
Added  
`\textasteriskcentered` . . 430, 441  
Corrected syntax descriptions . . . 418  
Removed `\aa` and `\AA` . . 430, 434, 437
- 1996-10-28 ltplain.dtx v1.1u  
General: (CAR) More doc changes . . 15  
`\dotfill`: Removed math mode . . . . 33
- 1996-10-29 ltplain.dtx v1.1v  
`\dotfill`: Got arithmetic correct  
(CAR) . . . . . 33
- 1996-10-29 ltspace.dtx v1.2u  
`\@gnewline`: Added macro . . . . . 379  
`\@no@lnbk`: Macro replaces `\@lnbk` and  
`\@no@lnbk` . . . . . 377  
`\:`: Corrected and rationalised code 377  
`\nolinebreak`: Reimplemented both  
using `\@no@lnbk` . . . . . 376
- 1996-10-31 ltfinal.dtx v1.0z  
General: Added extra `\lcode`, hoping  
it does no harm in T1  
(pr/1969) . . . . . 1097, 1104
- 1996-10-31 ltlists.dtx v1.0p  
`\@trivlist`: Added check for missing  
item in outer list . . . . . 747
- 1996-10-31 ltsect.dtx v1.0y  
General: Corrected and tidied  
documentation; removed long  
lines . . . . . 834
- 1996-11-03 ltplain.dtx v1.1w  
`\dotfill`: Saved tokens by using  
`\hb@xt@` . . . . . 33
- 1996-11-04 ltterror.dtx v1.2m  
`\@nodocument`: Always define  
`\@nodocument` in kernel, so that it  
can be cleared by `\document`. . . 348
- 1996-11-04 ltlists.dtx v1.0q  
`\@trivlist`: Moved check for missing  
item: only checked when not  
inlabel flag is false . . . . . 747
- 1996-11-05 ltfiles.dtx v1.1i  
`\nofiles`: Standard `\if@nbreak` test  
added . . . . . 401
- 1996-11-09 ltmath.dtx v1.1c  
`\@ensuredmath`: Made long, as it was  
before. /2104 . . . . . 735
- 1996-11-18 ltffsbas.dtx v3.0s  
`\define@newfont`: (DPC) lowercase fd  
file names. internal/1044 . . . . . 488
- 1996-11-18 ltoutenc.dtx v1.8d  
General: (DPC) lowercase external file  
names. internal/1044 . . . . . 460
- 1996-11-20 fontdef.dtx v2.2p  
General: lowercase fd and enc.def file  
names /1044 . . . . . 612
- 1996-11-20 ltvers.dtx v1.0f  
General: Check for old format  
modified /2319 . . . . . 38
- 1996-11-23 ltoutenc.dtx v1.8e  
General: Corrected description . . . . 418  
Extended description . . . . . 419
- 1996-11-28 ltvers.dtx v1.0g  
General: Check for old format  
modified /2319 . . . . . 38
- 1996-12-06 ltdirchk.dtx v1.0u  
`\IfFileExists`: \*\*\* removed from  
various messages for GNU Make.  
internal/2338 . . . . . 10
- 1996-12-06 ltfloat.dtx v1.1r  
`\@caption`: Call `\@setminpage` if  
needed. latex/2318 . . . . . 850
- 1996-12-06 ltffssini.dtx v3.0h  
General: (DPC) Remove \*\*\* from  
messages internal/2338 . . . . . 610
- 1996-12-17 ltdefs.dtx v1.0w  
`\g@addto@macro`: Use `\begingroup` to  
save making a mathord . . . . . 113
- 1996-12-20 ltsect.dtx v1.0z  
`\@dottedtocline`: Added `\nobreak` for  
latex/2343 . . . . . 845
- 1997-01-08 fontdef.dtx v2.2q  
General: Use `\DeclareMathDelimiter`  
to set delimiter codes . . . . . 621  
`\mathparagraph`: Define using  
`\DeclareMathSymbol` . . . . . 630
- 1997-01-08 ltfiles.dtx v1.1j  
`\@include`: reset `\deadcycles`  
latex/2365 . . . . . 405
- 1997-01-08 ltmath.dtx v1.1d  
`\root`: (DPC) Remove spurious space  
tokens from plain T<sub>E</sub>X definition  
/2359 . . . . . 725
- 1997-02-05 ltdefs.dtx v1.0x  
`\g@addto@macro`: missing percent  
/2402 . . . . . 113
- 1997-02-21 ltlists.dtx v1.0r  
`\@item`: `\ifvoid` check added for  
`\noindent`. latex/2414 . . . . . 751
- 1997-03-21 ltcounts.dtx v1.1e  
`\fnsymbol`: Use `\mathsection` and  
`\mathparagraph`. latex/2445 . . . 468
