

penlightplus

Additions to the Penlight Lua Libraries

Kale Ewasiuk (kalekje@gmail.com)

2023-09-04

This package first loads the `[import]penlight` package.

The `pl` option may be passed to this package to create an alias for `penlight`.

`globals` option may be used to make several of the functions global (as discussed below).

texlua usage

If you want to use `penlightplus.lua` with the `texlua` interpreter (no document is made, but useful for testing your Lua code), you can access it by setting `__SKIP_TEX__ = true` before loading. For example:

```
package.path = package.path .. ';'..'path/to/texmf/tex/lualatex/penlightplus/?.lua'
package.path = package.path .. ';'..'path/to/texmf/tex/lualatex/penlight/?.lua'
penlight = require'penlight'
```

```
__SKIP_TEX__ = true  --only required if you want to use
                      --penlightplus without a LaTeX run
__PL_GLOBALS__ = true -- optional, include global definitions
```

```
require'penlightplus'
```

The following global Lua variables are defined:

`__SKIP_TEX__` If using the `penlightplus` package with `texlua` (good for troubleshooting), set this global before loading `penlight`

The gloals flags below are taken care of in the package options:

`__PL_GLOBALS__` If using package with `texlua` and you don't want to set some globals (described in next sections), set this global before to `true` loading `penlight`

`__PL_NO_HYPERREF__` a flag used to change the behaviour of a function, depending on if you don't use the hyperref package
`__PDFmetadata__` a table used to store PDF meta-data

penlight additions

Some functionality is added to penlight and Lua.

`pl.hasval(x)` Python-like boolean testing
`COMP'xyz'()` Python-like comprehensions:
<https://lunarmodules.github.io/Penlight/libraries/pl.comprehension.html>
`math.mod(n,d)`, `math.mod2(n)` math modulus
`string.totable(s)` string a table of characters
`string.delspace(s)` clear spaces from string
`pl.char(n)` return letter corresponding to 1=a, 2=b, etc.
`pl.Char(n)` return letter corresponding to 1=A, 2=B, etc.

`pl.utils.filterfiles(dir,filt,rec)` Get files from dir and apply glob-like filters. Set rec to true to include sub directories

A `pl.tex.` module is added

`add_bkt_cnt(n)`, `close_bkt_cnt(n)`, `reset_bkt_cnt` functions to keep track of adding curly brackets as strings. `add` will return `n` (default 1) `{`'s and increment a counter. `close` will return `n` `}`'s (default will close all brackets) and decrement.
`_NumBkts` internal integer for tracking the number of brackets
`opencmd(cs)` prints `\cs {` and adds to the bracket counters.

`xNoValue,xTrue,xFalse`: xparse equivalents for commands

`prt(x)`, `prtn(x)` print without or with a newline at end. Tries to help with special characters or numbers printing.
`prt1(l)`, `prtt(t)` print a literal string, or table
`wrt(x)`, `wrtm(x)` write to log
`help_wrt(s1, s2)` pretty-print something to console. S2 is a flag to help you find., alias is `wrth`
`prt_array2d(tt)` pretty print a 2d array

`pkgwarn(pkg, msg1, msg2)` throw a package warning
`pkgerror(pkg, msg1, msg2, stop)` throw a package error. If stop is true, immediately ceases compile.

`defcmd(cs, val)` like `\gdef`, but note that no special chars allowed in `cs` (eg. `@`)
`defmacro(cs, val)` like `\gdef`, allows special characters, but any tokens in `val` must be pre-defined (this uses `token.set_macro` internally)
`newcmd(cs, val)` like `\newcommand`
`renewcmd(cs, val)` like `\renewcommand`
`prvcmd(cs, val)` like `\providecommand`
`deccmd(cs, dft, overwrite)` declare a command. If `dft` (default) is `nil`, `cs` is set to a package warning saying '`cs`' was declared and used in document, but never set. If `overwrite` is true, it will overwrite an existing command (using `defcmd`), otherwise, it will throw error like `newcmd`.
`get_ref_info(l)` accesses the `\r @label` and returns a table

global extras

If the package option `globals` is used, many additional globals are set for easier scripting. All `pl.tex` functions, and variables, `pl.hasval`, `pl.COMP`, `pl.utils.kpairs`, `pl.utils.npairs` become globals. `pl.tablex` is aliased as `TX` (which also includes all native Lua table functions), and `pl.array2d` is aliased as `A2d`.

Macro helpers

`\MakeluastringCommands [def]{spec}` will let `\pllustring (A|B|C..)` be `\luastring (N|O|T|F)` based on the letters that `spec` is set to (or `def` if nothing is provided) This is useful if you want to write a command with flexibility on argument expansion. The user can specify `n`, `o`, `t`, and `f` (case insensitive) if they want no, once, twice, or full expansion. For example, we can control the expansion of args 2 and 3 with arg 1:

```

\NewDocumentCommand{\splitToComma}{ O{nn} m m }{%
  \MakeluastringCommands[nn]{#1}%
  \luadirect{penlight.tex.split2comma(\pllustringA{#2},\pllustringB{#3})}%
}

```

Lua boolean expressions for LaTeX conditionals

`\ifluax {<Lua expr>}{<do if true>}{<do if false>}` and
`\ifluax {<Lua expr>}{<do if true>}{<do if false>}` for truthy (uses `penlight.hasval`)

<pre> 1 \ifluax{3^3 == 27}{3*3*3 is 27}[WRONG]\\ 2 \ifluax{abc123 == nil}{Var is nil}[WRONG]\\ 3 \ifluax{not true}{tRuE}[fAlSe]\\ 4 \ifluax{''}{TRUE}[FALSE]\\ 5 \ifluaxv{''}{true}[false]\\ </pre>	<pre> 3*3*3 is 27 Var is nil fAlSe TRUE false </pre>
---	--

Creating and using Lua tables in LaTeX

penlightplus provides a Lua-table interface. Tables are stored in the `penlight.tbls` table.

`\newtbl {t}` declares a new table with name `t`
`\chgtbl {t}` changes the 'recent' table
`\tblfrkv {t}{key-val string}[luakeys opts]` new table from key-val's using `luakeys`
`\tblfrcsv` a shorthand `\tblfrkv {t}{csv}[naked_as_value=true,opts]`, a good way to convert a comma-separated list to an array
`\settbl {i}{v}` sets a value of the table/index `i` to `v`
`\gettbl {i}` gets the value and `tex.sprint()`'s it
`\deftbl {i}{d}` pushes the value to a `cs` named `d`
`\gdeftbl {i}{d}` pushes the value to a global
`\iftbl {i}{tr}[fa]` runs code `ta` if the item is true else `fr`
`\iftblv {i}{tr}[fa]` runs code `ta` if the item is truthy else `fr`
`\kvtblundefcheck` will throw an error if you use define a table from key-values and use a key that was not specified in the `luakeys` parse options via `opts.defaults` or `opts.defs`.

There are 3 ways to use the index (placeholder `{i}` above). `t.key` where `t` is the table name and `key` is a string key, `t/int` where `int` is an integer index (ie. uses `t[int]`, note that negative indexes are allowed where -1 is the last element), or simply use `ind` without the table name, where the assumed table is the last one that was created or changed to, (passing a number will used as an integer index).

1	<code>\tblfrkv{my}{a,b,c,first=john,last=smith}%</code>	
2	<code>[defaults={x=0,1=one,n=false,y=yes}]</code>	true
3	<code>\gettbl{my.a}\\</code>	0
4	<code>\gettbl{my.x}\\</code>	fa
5	<code>\iftbl{n}{tr}[fa]\\</code>	FA
6	<code>\iftblv{n}{TR}[FA]\\</code>	Tr
7	<code>\iftbl{my.y}{Tr}[Fa]\\</code>	tR
8	<code>\iftblv{y}{tR}[fA]\\</code>	john
9	<code>%% \kvtblundefcheck % would throw error</code>	smith john
10	<code>\deftbl{my.first}{mydef} \mydef\\</code>	smith
11	<code>{\deftbl{last}{mydef} \mydef} \mydef\\</code>	
12	<code>{\gdeftbl{last}{mydef}} \mydef\\</code>	
13		
14	<code>\tblfrcsv{me}{a,b,"c,see",d,e}</code>	a,b
15	<code>\gettbl{me/1},\gettbl{2}\\</code>	c,see
16	<code>\gettbl{3}\\</code>	D
17	<code>\settbl{me/4}{D}\gettbl{me/4}\\</code>	E
18	<code>\settbl{5}{E}\gettbl{5}\\</code>	D,E
19	<code>\gettbl{-2},\gettbl{me/-1}\\</code>	
20	<code>%% \gettbl{k} % would throw error</code>	

Splitting strings

Splitting text (or a cmd) into oxford comma format via: `\splitToComma [expansion level]{text}{text to split on}`:

1	<code>-\splitToComma{ j doe }{\and}-\\</code>	-j doe-
2	<code>-\splitToComma{ j doe \and s else }{\and}-\\</code>	-j doe and s else-
3	<code>-\splitToComma{ j doe \and s else \and a per }{\and}-\\</code>	-j doe, s else, and a per-
4	<code>-\splitToComma{ j doe \and s else \and a per \and f guy}{\and}-</code>	-j doe, s else, a per, and f
5		guy-
6	<code>\def\authors{j doe \and s else \and a per \and f guy}</code>	j doe, s else, a per, and f
7	<code>\splitToComma[o]{\authors}{\and}</code>	guy

The expansion level is up to two characters, `n|o|t|f`, to control the expansion of each argument.

You can do a similar string split but to `\item` instead of commas with `\splitToItems`

```

1 \begin{itemize}
2   \splitToItems{kale\and john}{\and}
3   \splitToItems{kale -john -someone  $\leftrightarrow$ 
   else}{-}
4   \splitToItems{1,2,3,4}{,}
5 \end{itemize}

```

- kale
- john
- kale
- john
- someone else
- 1
- 2
- 3
- 4
